OpenText™ Active Directory Bridge is a solution that extends Active Directory (AD) capabilities by enabling domain controllers to add on premises Linux servers and Linux virtual machines in the Cloud to the AD environment to interface with identity services, group policies, and domain resources. This is accomplished with the installation of an OpenText Active Directory Bridge Linux Agent on Linux computers, OpenText Active Directory Bridge and Cloud Gateways each and a GPMC snap-in tool "AD Bridge GPEdit Extension" on a workstation which is a domain member.
