Welcome to Serena StarTool DA Batch

Product Description	Thank you for choosing Serena® StarTool® DA (Dump Analyzer), the intelligent dump analysis and debugging tool for IBM z/OS mainframes. StarTool DA helps mainframe software engineers diagnose the causes of ab normal e nd-of-job (ABEND) conditions. The product provides automated dump diagnostics, interactive call tracing support, dump archiving and maintenance, and a full-featured debugging interface.
Batch, CICS, DB2, and IMS	
	StarTool DA supports analysis and debugging of both batch and CICS ABENDs. Optional debugging support for IBM DB2 and IMS database ABENDs is also available.
	ChangeMan ZMF
	Users of Serena® ChangeMan® ZMF may optionally integrate their software change management system with the debugging support of StarTool DA using StarTool DA's ZMF Integration Option.
Document Objectives	The <i>StarTool DA Batch User's Guide</i> manual provides information about using the interactive debugging features of StarTool DA Batch to assist with the diagnosis and resolution of mainframe batch program ABENDs.
Audience	This information is intended for mainframe programmers who use StarTool DA as an ABEND debugging tool. Familiarity with IBM mainframe computer systems and IBM mainframe COBOL and assembly language programming is assumed.

Before You Begin

See the Readme for the latest updates and corrections for this manual. You can download the latest version of the Readme from the [Serena support website](#).

Conventions

Terminological	The following terminological and style conventions are used throughout this document: <ul style="list-style-type: none">■ z/OS™ represents the z/OS and OS/390® IBM® operating systems.■ StarTool DA Batch also is referred to as CICS Dump Analyzer or DA CICS.■ Examples may show either StarTool DA or ChangeMan ZMF-DA in screen and print titles. The product name in the title indicates whether the StarTool DA installation is configured to integrate with ChangeMan ZMF, and both types of installations were used in the preparation of examples for this manual.
Typographical	The following typographical conventions are used in the online manuals and online help. These typographical conventions are used to assist you when using the documentation;

they are not meant to contradict or change any standard use of typographical conventions in the various product components or the host operating system.

Convention	Explanation
<i>italics</i>	Introduces new terms that you may not be familiar with and occasionally indicates emphasis.
bold	Emphasizes important information and field names.
UPPERCASE	Indicates keys or key combinations that you can use. For example, press the ENTER key.
monospace	Indicates syntax examples, values that you specify, or results that you receive.
monospaced <i>italics</i>	Indicates names that are placeholders for values you specify; for example, filename.
vertical rule	Separates menus and their associated commands. For example, select File Copy means to select Copy from the File menu. Also, indicates mutually exclusive choices in a command syntax line.

Documentation

StarTool DA publications include the Readme file and the following:

Title	Description
<i>Serena® SER10TY User's Guide</i>	Installation information for SER10TY licensing software and instructions on how to apply license key SERtificates.
<i>Serena® StarTool® DA Batch User's Guide</i>	Concepts, features, and functions of StarTool DA Batch, which provides dump analysis and ABEND recovery assistance in a batch environment.
<i>Serena® StarTool® DA CICS User's Guide</i>	Concepts, features, and functions of StarTool DA CICS, which provides dump analysis and ABEND recovery assistance in a CICS environment.
<i>Serena® StarTool® DA Messages</i>	A consolidated message reference for all product options, with error recovery recommendations.
<i>Serena® StarTool® DA Installation and Setup</i>	A guide on how to install and configure StarTool DA Batch and StarTool DA CICS.
<i>Serena® StarTool® DA Batch Training Guide</i>	A quick-start guide to StarTool DA Batch basic features and functions.
<i>Serena® StarTool® DA CICS Training Guide</i>	A quick-start guide to StarTool DA CICS basic features and functions.

Accessing the Documentation

The *StarTool DA Installation and Setup* manual and the *Serena SER10TY User's Guide* are shipped with the product as printed manuals and are included on the product media. In addition, the full documentation suite is provided in electronic form on the Serena Support website.

You may copy the electronic documentation to an intranet server for internal use, subject to the terms of the Master License and Services Agreement (MLSA).

Accessing Documentation Online

All product documentation is available for download to licensed customers on the Serena Customer Support website at <http://support.serena.com>. A user ID and password are required to log on to the website.

- 1 After logging onto the site, click on the **My Downloads** tab.
- 2 From the list of products in the **Please Select Product** drop-down menu, select StarTool DA.
- 3 In the download list, find the desired version of StarTool DA, then click the **Download Documentation** link for that version.
A page displays a list of available documentation for the selected release.
- 4 Click the **Download** link for the document you want to download.

Using the PDF Documentation

To view PDF files, use Adobe® Reader®, which is freely available from www.adobe.com.

TIP Be sure to download the *full version* of Reader. The more basic version does not include the search feature.

This section highlights some of the main Reader features. For more detailed information, see the Adobe Reader online help system.

The PDF manuals include the following features:

- **Bookmarks.** All of the manuals contain predefined bookmarks that make it easy for you to quickly jump to a specific topic. By default, the bookmarks appear to the left of each online manual.
- **Links.** Cross-reference links within a manual enable you to jump to other sections within the manual and to other manuals with a single mouse click. These links appear in blue.
- **Printing.** While viewing a manual, you can print the current page, a range of pages, or the entire manual.
- **Comments.** All PDF documentation files that Serena delivers with ChangeMan ZMF have enabled commenting with Adobe Reader. Adobe Reader version 7 and higher has commenting features that enable you to post comments to and modify the contents of PDF documents. You access these features through the Comments item on the menu bar of the Adobe Reader.
- **Advanced search.** Starting with version 6, Adobe Reader includes an advanced search feature that enables you to search across multiple PDF files in a specified directory. (This is in addition to using any search index created by Adobe Catalog—see step 3 below.)

To search within multiple PDF documents at once, perform the following steps (requires Adobe Reader version 6 or higher):

- 1** In Adobe Reader, select **Edit > Search** (or press **CTRL+F**).
- 2** In the text box, enter the word or phrase for which you want to search.
- 3** Select the **All PDF Documents in** option, and browse to select the folder in which you want to search.
- 4** Optionally, select one or more of the additional search options, such as **Whole words only** and **Case-Sensitive**.
- 5** Click the **Search** button.

NOTE Optionally, you can click the **Use Advanced Search Options** link near the lower right corner of the application window to enable additional, more powerful search options. (If this link says **Use Basic Search Options** instead, the advanced options are already enabled.) For details, see Adobe Reader's online help.

Chapter 1

Introduction

StarTool DA is a dump management system that provides detection, capture, notification, diagnostics, and analysis for application abends. It is specifically engineered to provide universally accepted IBM dumps, such as CICS formatted transaction dumps and IBM SVC (SDUMP) dumps, so that you can eliminate the process of production problem replication.

StarTool DA has a flexible interface to integrate with the z/OS™ and OS/390® IBM® operating systems. All dumps normally requested by z/OS or OS/390 are supported by StarTool DA.

StarTool DA is easy to install, use, and maintain. With a minimum learning curve, it can help you improve the reliability of your systems and increase the productivity of systems and application programmers.

Conceptual Overview	12
Component Overview	13

Conceptual Overview

StarTool DA captures information on the abending program and the system and produces applicable diagnostics in various formats.

If an abend occurs and a SYSUDUMP, SYSMDUMP, or SYSABEND DD is present, the operating system creates a dump. Alternatively, if an abnormal situation occurs within the z/OS Language Environment, control is passed to an LE exit that StarTool DA replaces. Under either condition, StarTool DA gets control and dynamically loads its modules to process the abend.

StarTool DA operates with default parameters, or you can customize them to suit your needs. You can change selection values such as the specific abend code, programming language, file access method, and MVS Control Table options. StarTool DA operates according to the MVS Control Table used at start-up.

Modes of Operation for COBOL

StarTool DA operates in Development Mode and Production Mode. You can use them interchangeably in the development and production environments. For both modes, the program must be compiled with the SOURCE, LIST, MAP, XREF, and NOOFFSET options.

Development mode

Development mode is a mode in which StarTool DA considers the abend as having come from a program that is still in development. This is defined by having the following DD statement in the execution JCL:

```
//ESPYCOBL DD DSN=xxxxxxxx
```

where `xxxxxxxx` is the name of the PDS (without the member name) or sequential data set that contains the compile listing to be used by StarTool DA. The compile listing is the SYSPRINT output from the compile step. After-the-abend program compiles are not supported.

Production mode

Production mode is a mode in which StarTool DA considers the abend as having come from a program that is in production. This is defined as all jobs that do not have an ESPYCOBL DD statement and those that pass the RAChecks within the StarTool DA product. Your StarTool DA Batch system administrator must add two StarTool DA Batch language processor steps to your compile JCL.

Types of Dumps

Three types of dumps are available with StarTool DA. You can produce any one or a combination of the following dumps by using the StarTool DA MVS Control Table (EMCT) or pre-defined DD names. The three types of dumps are:

- Mini Dump – The Mini Dump Debug Report includes only the essential information you need to diagnose and solve the abend. The information is specific to the type of abend, the language of the failing program, and the types of files or databases in use. The report also shows the failing COBOL statement and the contents of the operands.
- IBM Formatted Dump – This is the traditional IBM SYSUDUMP, SYSABEND, or SYSMDUMP. These dumps are only produced when their DD names are detected in the

abending step. Many vendors require one of these dumps before attempting any error analysis.

NOTE StarTool DA does not produce diagnostic information unless it detects the presence of one of these DD names: SYSUDUMP, SYSABEND, SYSMDUMP.

- Debug/Viewing Server Dump (DVS) – The DVS dump has two parts:
 - The same diagnostic information available in the Mini Dump, but accessed through the DVS menu system.
 - An IBM system dump that is generated dynamically when the abend occurs. Access this dump only when you need to look at actual system dump storage. StarTool DA/DVS provides you with formatted access to this system dump.

Since this dump is in IBM system dump format, it can be sent to any vendor for additional abend diagnostics.

See [Chapter 2, "Debugging and Viewing Server" on page 17](#).

Component Overview

StarTool DA consists of the following components:

- Error Detector Server (EDS)
- Workload Server
- Debug/Viewing Server (DVS)
- Language Server
- ChangeMan ZMF Option

The following options are separately licensed:

- DB2 Option
- IMS Option

Error Detector Server

The Error Detector Server (EDS) detects any abend condition, intercepts the abend and dump, supplements the dump management capabilities of IBM dump processors, and captures information that would otherwise be unavailable.

The Error Detector logs information to the console or SMF for management and problem reporting. Diagnostic information is written to a Mini Dump Debug Report for you to view in your job output, or formatted for viewing using the Debug/Viewing Server (DVS).

The Error Detector Server resides within z/OS. It is reentrant and provides a maximum level of integrity and a minimum amount of exposure to your production systems.

Workload Server

The Workload Server works behind the scenes. It suppresses duplicate dumps, processes all the captured information from the Error Detector Server, and stores the information in a database structure.

Debug/Viewing Server

The Debug/Viewing Server (DVS) allows you to see your Mini Dump and diagnostic data through an ISPF-based menu system. Although similar to the Mini Dump report, it allows you to choose only the panels you need to diagnose and solve the abend, including those in a shared DASD environment (for remote viewing).

The debug panels are specific to the type of abend, the language of the failing program, and the types of files or databases used.

Your security profile determines the dumps you can access. RAChecks are performed and only those dumps that you can view display in DVS.

Language-specific information shows the abending statement (COBOL, ASM-H, HLASM) as well as the contents of instruction operands. You can view the dump, source code, data division, contents of any field, as well as a language-specific (COBOL, BAL) Debug/Analysis Section.

DVS supports all system dumps that are generated under z/OS. DVS tracks all abend activity, isolates user-defined output, and provides a comprehensive security system. The DVS database index summarizes abend activity in a concise, easy to use format.

Other features of the Debug/Viewing Server (DVS) include:

- COBOL Debug Facilities – allow you to view the dump, source code, data division, and content of fields. The Point-and-shoot facility allows you to trace the COBOL Procedure Division program flow. A pop-up panel shows you the COBOL statement operands and their contents at abend time.
- Multiple Viewing Options – give you more than one way to view your diagnostic data. You can view your output using compatibility mode, ISPF Debug/Viewing Server or IPCS Viewer. Compatibility mode allows you to see your Mini Dump and diagnostic data. Debug/Viewing Server mode is a full ISPF viewer/server. IPCS mode allows you to view system dump information as well as original data using IBM IPCS.
- Remote Viewing – allows you to view dumps from another MVS system. The DBI (database index) must reside on shared DASD.
- Disassembler Function – creates the assembler code from a load module to assist in the dump solving process.
- Formatted Control Blocks – control blocks are formatted into an easily understandable format. DCBs and ACBs are listed and corresponding data items clearly display.
- Last Record Read/Written – the last record read/written for every open file is listed. All access methods are supported (BSAM, QSAM, VSAM, BPAM, and so on).
- Online HELP facilities – contain information on abend codes, reducing the need for abend code manuals.

Language Server

The Language Server analyzes the abend at the source language level. The Language Server allows input source-level debugging of a program, compiler output source-level,

and assembler level debugging. The language database is built at translate, compile, and link-edit time.

When you need detailed source information for a COBOL abend, the Language Server merges actual source code into the Mini Dump Debug Report and creates debug information to be used by the Debug/Viewing Server. At compile time, the Language Server stores the source listing in a language database. The source listing information is automatically available online through the Debug/Viewing Server (DVS).

A significant benefit is the flexibility of obtaining source support. When a compiled listing is not available at abend time, simply recompile before viewing the debug information with DVS.

The Language Server provides:

- The source code of the statement in error displayed in the Failing Instruction Section. All fields in the abending statement are also shown for data related abends.
- The names and contents of all individual fields displayed in the Working Storage Section.
- The Procedure Division source code displayed in the Program Listing Section with the abending statement indicated.

DB2 Option

The DB2 option supports call-attach programs, TSO-attach programs, and stored procedures.

The DB2 options produces the following sections of diagnostic information:

- SQL Call Summary – contains DB2 subsystem name, plan name, program name, statement number, address of CICS SQL call, Plist and SQLCA interpretation.
- Plan Information – contains the plan name, bind date and time, etc.
- Package Information – contains package information, such as precompile date/time, etc.
- DBRM Information – contains information about the DBRM.
- SQL Statement – contains the formatted last SQL statement.
- Host Variables – contains names and contents of the host variables associated with the last SQL call.

IMS Option

- Produces diagnostic information to assist in the analysis of IMS application program dumps.
- Provides information for all PCBs used by the program, and the facility to display the PCB storage in the dump (using the Point-and-Shoot feature in DVS).
- Displays the last DL/I call information, including user-specified parameters, function code, and their addresses.
- Supports region types DL/I Batch, BMP, MPP, IFP (Fast Path), and DBB.
- Supports PCB types TP (I/O and Alternate), DB, Fast Path (MSDB & DEDB), GSAM.
- Supports all PSBGEN languages and most DL/I-Call languages.

ChangeMan ZMF Option

The ChangeMan ZMF Option lets you access information for the package in which the abending program resides. The ZMF option:

- Provides information for the load component and the package containing the abending program.
- Displays history information for the component. All of the packages containing the component appear.
- Displays the ChangeMan ZMF listing.

Chapter 2

Debugging and Viewing Server

Use the Debugging and Viewing Server (DVS) to:

- Delete source listings from the language database
- Delete dump data sets
- Process dump data sets with IPCS
- View StarTool DA dump reports with DVS
- View StarTool DA Batch MVS remote dumps
- View applicable ChangeMan data and program listing

See the following topics for more information:

Starting a DVS Session	18
Using the DVS Panels	22
Multilevel Storage Viewing	52
Program Call/Trace Summary for Inactive Modules	54

Starting a DVS Session

To use the DVS panels, select StarTool DA from your ISPF/PDF menu. If it is not on the ISPF menu, contact your installer for instructions to gain access to StarTool DA.

If StarTool DA CICS and DA are installed at your site, the first panel that displays is the StarTool DA Primary Option Panel allowing you to select either DA CICS or DA Batch.

```
ESPYAP01 ----- StarTool DA Primary Option Panel -----
Command/Option ===>                                         Use PF3/END

Select a StarTool DA application

Your selection ===> 2   1 = StarTool DA CICS
                           2 = StarTool DA Batch
```

This example is for DA Batch. The DBI Selection Panel displays from which you select a local or remote DBI (assuming you specified remote DBIs in your WLS JCL).

```
----- StarTool DA : DBI Selection Panel -----
COMMAND ===>

Select local or remote DBI
Local DBI: _ WST001.DA.ES01.E390.DBKF

Remote DBI:ID      Dataset Name
             _ Q002      WST001.DA2.ES01.E390.DBKF
```

When you select a DBI, all processing for the remainder of the session uses the selected DBI. If you want to process a different DBI, you must back out to the DBI Selection Panel and select a different DBI.

When you select the DBI, the Initial DVS Dump Selection Panel displays. If your site has not implemented the StarTool DA remote viewing option, this panel automatically displays first.

```
----- StarTool DA : Initial DVS Dump Selection Panel -----
COMMAND ===>

Overtype any or all selection criteria to view specific
StarTool DA DVS Data Sets.
- O R -
Press enter to view DVS Data Sets with the designated prefix.

DSN Selection Prefix: USER298

Jobname:           Abend Code:           Program Name:
Search Start Date: MM/DD/YYYY
View Source Listing Directory: _
Current Source Listing Directory: WST001.DA.ES01.E390.DBKF
```

From the Initial DVS Dump Selection Panel, you can select the dumps to view by specifying:

- DSN Selection Prefix

- Jobname
- Abend Code
- Program Name
- Search Start Date
- DDname (View Source Listing Directory)

The default high-level qualifier for the DSN Selection Prefix is the owner ID of the job. The StarTool DA administrator can change this high-level qualifier by modifying the EMCT table.

The Current Source Listing Directory for the language database displays at the bottom of the screen. You can change to a different Source Listing Directory (if you use multiple language databases).

When Exit (PF3) is pressed on the **Initial DVS Dump Selection Panel** (ESPYIPA0), DVS redisplays the **DBI Selection Panel** (ESPYIPAH), allowing the specification of an alternate DBI for processing.

Selecting a Dump Data Set

When you press Enter on the Initial DVS Dump Selection Panel (and the View Source Listing Directory field is blank), the Dump Data Set Selection panel appears. Only those dumps that you are authorized to view display (RACF security checks are performed on your user ID). The dumps listed are selected from those in the selected DBI (either the local DBI or the remote DBI).

NOTE To add remote dumps to your DVS, you must first know where your DBI (Database index) files reside. The remote DBIs are identified by the RDBIx^{xxxx} DD statements in the DA WLS (Workload Server) JCL. The ^{xxxx} value in the DDname is user-definable. See *Appendix C: Workload Server in the Serena® StarTool® DA Installation Guide*.

```
----- StarTool DA : Dump Data Set Selection -----
COMMAND ==>                               SCROLL ==> PAGE

-- Enter 'V' in Selection Field to enter 'Dump View Server' Main Menu.
-- Enter 'I' in Selection Field to Process DVS Data Set with IPCS.
-- Enter 'D' in Selection Field to delete the DUMP data set.
-- Press PF10 or PF11 to display additional selection data.

S Jobname        Program      Abend      Date          Time
_ T1407400       PAYROLL7    SOC7 -    DECEMBER 17, 2003 13:29:29
_ T1407401       PAYROLL7    SOC7 -    DECEMBER 17, 2003 13:35:00
_ T1712360       PAYROLL7    SOC7 -    DECEMBER 17, 2003 13:12:36
_ T171236M       PAYROLL7    SOC7 -    DECEMBER 17, 2003 13:07:33
***** Bottom of data *****
```

Selecting Options from the DVS Selection Menu

Type V in the Selection Field to display the DVS Selection Menu screen, shown below. (To view remote dumps, you must have included RDBIx^{xxxx} DD statements in the Workload

Server startup PROC to list remote dumps, and you must have selected a remote DBI for dump selection. See *Activating the Workload Server* in the *DA Installation Guide*.)

DVS obtains temporary shared ownership of the dump selected for viewing. Select an option from this menu to diagnose the Abend description in the Title field. The DVS panels are described in [Using the DVS Panels](#).

```
----- StarTool DA : DVS Selection Menu -----COMMAND
====>

L Load a source listing to DA

Enter number of selected Option or END(PF3) To EXIT.
```

Processing a Dump Data Set with IPCS

IPCS allows you to view SNAPS as well as SDUMPs using the IBM IPCS. SDUMPs and SNAPS are formatted by DA into IBM Sys1.Dump format. Because all the record types and internal formatting options are the same as IBM SDUMPs, you can use IPCS to view or format output.

To invoke IPCS for a system dump, type I next to the Program name on the Dump Data Set Selection panel. The IPCS Primary Option Menu displays.

```
----- IPCS PRIMARY OPTION MENU -----
OPTION ==> 0

0 DEFAULTS      - Specify default dump and options          * USERID   - USER298
1 BROWSE        - Browse dump data set                      * DATE     - 03/15/03
2 ANALYSIS      - Analyze dump contents                     * JULIAN   - 02.196

T TUTORIAL      - Learn how to use the IPCS dialog
X EXIT          - Terminate using log and list defaults
*****
```

Enter END command to terminate IPCS dialog

To see the IPCS Default Values, choose Option 0 from the IPCS Primary Option Menu; the IPCS Default Values panel displays. The default dump data set name in the Source field is the dump you selected on the Dump Data Set Selection panel. Because StarTool DA formats even SNAP dumps similar to SDUMPs (just smaller), you can use IPCS to do your

viewing and debugging. However, most application dumps are easier to solve using the Debug/Viewing Server (DVS).

```
----- IPCS Default Values -----
Command ==>

You may change any of the defaults listed below. The defaults shown before
any changes are LOCAL. Change scope to GLOBAL to display global defaults.

Scope ==> LOCAL (LOCAL, GLOBAL, or BOTH)

If you change the Source default, IPCS will display the current default
Address Space for the new source and will ignore any data entered in
the Address Space field.

Source ==> DSNAME('USER298.ESPY.D011227.T150307.S001')
Address Space ==>
Message Routing ==> NOPRINT TERMINAL
Message Control ==> CONFIRM VERIFY FLAG(WARNING)
Display Content ==> NOMACHINE REMARK REQUEST NOSTORAGE SYMBOL

Press ENTER to update defaults.

Use the END command to exit without an update.
```

Deleting a DUMP Data Set

When you type D (delete the DUMP data set) in the Selection Field, the system displays a pop-up screen requesting that you confirm the decision to delete the dump data set. If you are sure you want this data set deleted, press the Enter key; otherwise, press the PF3 key to return to the Dump Data Set Selection screen.

```
----- StarTool DA : Dump Data Set Selection -----
COMMAND ==>                               SCROLL ==> PAGE

-- Enter 'V' in Selection Field to enter 'Dump View Server' Main Menu.
-- Enter 'I' in Selection Field to Process DVS Data Set with IPCS.
-- Enter 'D' in Selection Field to delete the DUMP data set.
-- Press ****
e           StarTool DA : Dump Data Set Deletion      e
S Jobname   e COMMAND ==>                           e me
D DA54B9DM  e                                     e 1:02
*****      e / Confirm request to delete a dump data set.  e *****
e           e                                         e
e           DSNAME= SRADHAN.ESPY.D030219.T111102.S001  e
e           e                                         e
e           Press the ENTER key to delete the selected data set.  e
e           Press PF3 to cancel the delete request.        e
e           e                                         e
*****
```

If you delete a data set, the entry still displays, but its status shows that it was deleted.

NOTE You cannot delete a dump that resides on another MVS system. Dumps selected from a remote DBI can be selected for viewing only. You can only delete a dump from the DVS that "owns" the local DBI that contains the dump.

Deleting a Source Listing from the Language Database

If you type Y in the View Source Listing Directory field on the Initial DVS Dump Selection Panel, the Source Module Display panel appears where you can view a directory of source listings within the Language Database. To delete an entry from the directory (DBKF), and from the VSAM source listing file, type D next to the entry.

```
----- StarTool DA : Source Module Display -----
COMMAND ==>                                     SCROLL ==> PAGE

Source Listing Directory: WST001.DA.ES01.E390.DBKF

-- Enter 'D' in Selection Field to delete the Source listing. --

```

Using the DVS Panels

The Debug/Viewing Server (DVS) displays your Mini Dump and diagnostic data. Although similar to the Mini Dump Debug Report, it allows you to choose only the panels you need to diagnose and solve the abend. The debug panels are specific to the type of abend, the language of the failing program, and the types of files or databases in use. The entire

COBOL source is viewable if you compiled your program (either before or after the abend) using the DA COBOL Language Server.

```
----- StarTool DA : DVS Selection Menu -----
COMMAND ==>

Title: ABEND S0C7 IN JOB USER298A AT 15:03:07 ON SATURDAY, MARCH 15, 2007

1 System and Job Information
2 Diagnostic Section
3 Failing Instruction Section
4 Reg Contents and PSW Info
5 Pgm Call Trace Summary
6 Program Storage
7 Pgm Listing (COBOL Only)
8 Data Mgmt Control Blocks
C ChangeMan ZMF Information
D Program Call/Trace Details
L Load a source listing to DA

Enter number of selected Option or END(PF3) To EXIT.
```

DVS allows you to see all the address space of the abended task without preloading the detail dump data set. For most COBOL programs, it is not necessary or desirable to incur this overhead because only Option 6 (Program Storage) requires this information. You can debug most COBOL programs by using the other menu options.

Assembler and complicated COBOL programs may require looking at all of the address space storage or just the abending program storage. If you select Option 6, you may notice a small delay while the system loads the dump into storage.

DVS is ISPF-based and is a full ISPF viewer/server. The point-and-shoot feature lets you trace through dump control blocks, addresses, and data sections of the program and dump.

To use point-and-shoot, place the cursor on the first or second byte of a hexadecimal address and press Enter. When the cursor is placed on the first byte, you are positioned at the 31-bit address; when the cursor is placed on the second byte, you are positioned at the 24-bit address.

NOTE DVS extracts source statements for viewing as follows:

When DA Batch processes the abend of a batch program, it locates and extracts from the DBKF the source for the abending statement and any associated data elements. It saves those source statements as part of the dump diagnostic data in the DBI data set.

If DA Batch is able to locate the source at the time of the abend, when DVS options 3 and 4 (Failing Instruction Section and Reg Contents and PSW Info) are subsequently selected, the displayed source statements are NOT extracted from the DBKF, they are extracted from the DBI data set.

If DA Batch is unable to locate the source at the time of the abend, DVS will attempt to extract the source from the DBKF when options 3 and 4 are selected.

Option 1 – System and Job Information

System and Job Information is the second panel of the Debug/Viewing Server. This is a standard section that always provides the same type of information. The System and Job Information Panel identifies:

- Date of the abend/error
- StarTool DA version
- Job name
- Step name
- Owner of job
- Time of the error
- Completion code

Other helpful information, in case you need to call Customer Support includes:

- CPU model number
- The operating system release level
- CP FMID
- System on which your program was executing
- Subsystem Release Info (for example: CICS/IMS/DB2)
- DFSMS release level
- JES2 release level

```
----- StarTool DA : System and Job Information -----
COMMAND ==>

Abend Date: March 15, 2007                                DVS Version:

Jobname:    USER298A      CPU Model: 2066      Operating System: MVS/SP 7.0.4
Stepname:   S010          CP FMID: HBB7707
Owner:      USER298       System: D001
                                         DFSMS: V3.3.2           Time: 15:03:07
                                         JES2: Z/OS 1.4

Completion Code: S0C7-
```

Option 2 – Diagnostic Section

The Diagnostic Section provides information to solve the problem. The cause of the error and corrective actions are described. The information varies, depending upon the programming language used and whether or not the error was external, data related, or something else.

For external errors, the diagnosis includes:

- Cause of the error
- DDNAME and data set name (whenever possible)

See [S813 \(Diagnostic Section Only\)](#) for an example of an external error.

For data-related errors, the Diagnostic Section provides:

- Type of error
- Fields in error
- Location (displacement) of the fields within their respective base locator cell number
- Contents of the fields in error
- Description of the error

Language specific information shows the abending statement (COBOL, ASM-H, HLASM) as well as the contents of instruction operands. It shows the failing COBOL statement and its operand contents if you compiled your program using the StarTool DA COBOL Language Server or used the Repository Data Set (RDS) to store your COBOL compile output.

The following panels show the diagnostic information for an S0C7 abend.

```
----- StarTool DA : Diagnostic Display -----
COMMAND ===>                                     SCROLL ===> PAGE

DVS Dump DSN: USER298.ESPY.D011227.T150307.S001
Title: ABEND S0C7 IN JOB USER298A AT 15:03:07 ON SATURDAY, March 15, 2007
Diagnostic Information
SYSTEM ABEND: S0C7

Description: This ABEND is a data exception and can only occur when
decimal (packed) instructions are used. One of the
following can cause this error:

1) The sign or digit codes of one or more bytes
manipulated by the packed or CONVERT TO BINARY
instructions is invalid for packed decimal use.
Packed decimal digits must be in the range 0 through
9, with only the sign digit being a digit in the range
A through F.

2) Fields in decimal (packed) arithmetic overlap
incorrectly.

3) A packed decimal multiplicand has too many high-order
significant digits.
```

```
----- StarTool DA : Diagnostic Display -----
COMMAND ===> SCROLL ==> PAGE

DVS Dump DSN: USER298.ESPY.D011227.T150307.S001
Title: ABEND S0C7 IN JOB USER298A AT 15:03:07 ON SATURDAY, March 15, 2007
Diagnostic Information

    Possible causes for this abend include:

        Subscript error, referenced beyond table
        COBOL: working storage not initialized
            bad data, should check data for errors
            garbage in a field being tested or displayed
            move zeroes to group level is display, had sublevels
                that were not
            period missing after imperative statements
            within AT END clause
            binary field in an arithmetic operation is not large
                enough to accept result

User Action: Correct the format of the data being manipulated by the
            packed decimal instructions in the program and rerun the
            job.
```

Option 3 – Failing Instruction Section

The Failing Instruction section provides the statement in error. Additional information includes:

- Failing Program name and offset
- Instruction sequence prior to and including abending instruction
- Compile date of the program compile date and Program-ID of compiler/assembler
- Load module name and load library name
- Linkage Editor Date of the abending program.

The information provided depends on the programming language used. The following examples show an Assembler program and a COBOL-LE program.

Assembler program example

```
----- StarTool DA : Failing Instruction Information -----
COMMAND ==>

The Failing Instruction is in Program (CSECT):

    ESPYAT39 at offset X' 00046E '

The Failing Instruction is:

====> AP      X'478'(4,R10),X'47C'(7,R10)      <===
*****   Failing Instruction Analysis   *****

Instruction Type= SS Number of Operands= 2

OP1 Type= ADDR ADDR= 00006478 Data= 0000001C
ER> OP2 Type= ADDR ADDR= 0000647C Data= C995A581 938984
```

COBOL-LE program example

NOTE If you compile the program in ChangeMan ZMF, it must use the LIST and MAP options to see the failing COBOL statement.

```
----- StarTool DA : Failing Statement Information -----
COMMAND ==>

The Failing Instruction is in Program (CSECT):

    PAYROLL7 at offset X'0003DA'

The Failing COBOL Statement is:

====> 000436      ADD SOC7-BADFIELD TO SOC7-GOODFIELD
====> 05 SOC7-GOODFIELD          PIC S9(5) COMP-3 VALUE 0.
      Value: 00000C
====> 05 SOC7-BADFIELD REDEFINES SOC7-BADFIELDC PIC S9(5) COMP-3.
      Value: 828184          <-- BAD SIGN DIGIT
```

For SOCx abends, the failing COBOL statement and its operand content display. Normally, this is all you need to solve and correct the problem. However, if you need to see more of the program's source to solve the problem, tab to the failing COBOL statement and point-and-shoot on this statement. The Debug/Viewing Server takes you to Section 7, Pgm Listing Section, and positions the panel on the failing statement. Press PF7 (UP) to examine the COBOL source prior to the failing instruction.

Option 4 – Register and PSW Information

The Register and Program Status Word (PSW) Information section displays Supporting Environmental Data, such as:

- StarTool DA Dump Title, including time and date of abend
- Job name
- Step name

- Program name
- Abend code
- Offset within load model of error
- Instruction length of failing instruction
- Abending Program PSW (Program Status Word)
- Failing Instruction that precipitated the abend
- Register contents (hex) at time of error and register descriptions
- Load module DDname, load module name, and the load library name
- Dump/Viewer Server Data Set Name that contains the raw dump

```
----- StarTool DA : Regs and PSW Display -----
COMMAND ==>

Title: ABEND S0C7 IN JOB USER298A AT 15:03:07 ON SATURDAY, March 15, 2007

In summary, if you point-and-shoot on any address (PSW or registers), the system takes you to Section 6: Pgm Storage to view the hexadecimal listing of storage. If you point-and-shoot on the failing COBOL instruction, the system takes you to Section 7: Pgm Listing Section to view the source code.

From the Regs and PSW Display panel, you can also use DA commands. For example, you can locate an area in storage using a register number, with or without offsets. If you type L R4+90 on the command line, the Storage Display panel displays. This is also useful for navigating control blocks.

```
----- StarTool DA : Regs and PSW Display -----
COMMAND ===> L R4+90

```

Option 5 – Program Call Trace Summary

The Program Call/Trace Summary shows you which programs were called and in what order. The initial panel gives the summary of the call and trace information and enables you to select the called programs for additional detail.

- Selectively display the formatted program storage for all COBOL programs in the calling chain. Included are the Task Global Table (TGT), Dynamic Storage Area (DSA), BLW cells, and BLL cells.
- Display of the source (option S) and trace table (option D) directly from this option rather than returning to the main DVS menu.
 - The display generated for option S is the same as that generated for option 7 on the main DVS menu
 - The display generated for option D is the same display as that generated for option D on the main DVS menu

NOTE This option provides the DVS menu equivalent of the COBOL Data Section in the minidump.

Viewing the Program Call and Trace Summary and Selecting a Called Program

When you select option 5 from the DVS Selection Menu, the Program Call / Trace Summary panel appears with a list of called programs.

```

ESPYIPAA -- ChangeMan ZMF-DA --- Program Call/Trace Summary - Row 1 to 2 of 2
COMMAND ==>                               SCROLL ==> PAGE

Call/Trace Summary and Application Program Attributes

To display a called program's COBOL storage and data, enter "S" into the
selection column and press enter. (Press PF1 for additional help).

---Called Pgm---- ----Called Pgm Attributes---- -----Caller----- ---Call---
S Program Load-Mod Comp Date Length Language Load-Mod Program Offset Mode
----- -----
  _ ESPYCB39 ESPYCB39 25 Apr 2011 006F8E COBOL/zos *SYSTEM*          Call
  _ ESPYCB39 ESPYCB39 25 Apr 2011 006F8E COBOL/zos CEEBINIT CEEBTOR 000000 Call
***** Bottom of data *****

```

The Call Trace Summary provides the following information:

- Called/linked programs on the save area chain
- Program locations where the calls occurred
- Identification of the program in error, when available
- Application Program Attributes listing:
 - Each load module and its program name
 - Compile Date, Length, and Language for each program (COBOL, HLA Assembler, and so on)

You can view program and data storage for selected called COBOL programs in the calling chain of the abending program.

Only called programs that have completed COBOL initialization processing are eligible for additional displays. DA Batch marks the programs that meet this criteria by placing an underscore in the S column of the called program's row.

Selecting COBOL Program Details to Display

To select one of these called programs for processing, replace the underscore with an S and press enter.

The COBOL Program Detail Selection Menu appears.

```
ESPYIPAI - ChangeMan ZMF-DA -- COBOL Program Detail Selection Menu -----

Option 6 – Program Storage

When you select Option 6, the Storage Display Selection Panel displays, where you can choose the initial area of storage you want to view. This option loads the detail dump data set for full screen viewing. You can see all of the abended task address space, control blocks, and data areas. You may notice a small delay while the dump is loaded into storage.

```
----- StarTool DA : Storage Display Selection Panel -----
COMMAND ===>

DVS DSN: USER298.ESPY.D011227.T150307.S001

Please select initial area of storage to view.

_ Area of Abending Instruction
S Storage of Entire Abending Program
_ Lowest Address in the Address Space
_ CVT      (System Communication Vector Table)
_ ASCB     (Job Address Space Control Block)
_ TCB      (Failing Task Control Block)
_ COBOL Working Storage (COBOL Programs Only)
```

To select where to start the storage display, type an S in the line command field and press Enter. Most users choose Storage of Entire Abending Program as a place to start.

Following is the Storage Display panel that appears when you choose Storage of Entire Abending Program.

```
----- StarTool DA : Storage Display -----

Commands for the Storage Display Panel

Use the following commands on the Storage Display panel.

LOCATE

Locates specific fields within the Storage Display panel. If the STARTING ADDRESS of the requested area is not in the dump, a message displays saying 'Starting Address is not in the dump'. The syntax is:

LOCATE operand or L operand

The following operands are supported:

addr	Displays the requested hexadecimal address
PSA	Displays Low Storage location 0 (zero)
PVT	Displays the starting address of 'Low Private Area'
CSA	Displays the starting address of 'Low Common Storage Area (CSA)'
LPA	Displays the starting address of 'Low Link Pack Area (LPA)'
MLPA	Displays the starting address of 'Low Modified Link Pack Area (MLPA)'
FLPA	Displays the starting address of 'Low Fixed Link Pack Area (FLPA)'
SQA	Displays the starting address of 'Low System Queue Area (SQA)'
NUC	Displays the starting address of the Nucleus
ESQA	Displays the starting address of 'High System Queue Area (ESQA)'

ELPA	Displays the starting address of 'High Link Pack Area (ELPA)'
EFLPA	Displays the starting address of 'High Fixed Link Pack Area (EFLPA)'
EMLPA	Displays the starting address of 'High Modified Link Pack Area (EMLPA)'
ECSA	Displays the starting address of 'High Common Storage Area (ECSA)'
EPVT	Displays the starting address of 'High Private Area'
PREV	Returns to the address that was displayed prior to the current address

FIND

Finds a string. The FIND command operates across all storage in the address space. The syntax is:

FIND *string* [prev] or F *string* [prev]

where *string* is either a hex or character string.

A hex string is represented as X'hex string' with an even number of bytes. A character string is represented as either C'character string' or just 'character string'.

In the following Storage Display panel, a FIND command is typed on the Command line.

```
----- StarTool DA : Storage Display -----
COMMAND ==> f 'multi-csect' SCROLL ==> PAGE

DAS (or DISASM)

DAS disassembles hexadecimal dump data where the cursor is positioned. If the cursor is not on valid hexadecimal data, the command is ignored. To execute this command, type DAS or DISASM on the command line; then position the cursor on hexadecimal data and press Enter. You can assign DAS or DISASM to a PF key.

In the following Storage Display panel, the DAS command is typed on the command line. Then, the cursor is positioned on a hexadecimal dump location.

Option 7 – Program Listing (COBOL only)

The Program Listing section is available only for COBOL. This panel displays the program source code and identifies the current statement. The current statement in the program in error is either the actual statement in error or the last call. The current statement in any program other than the program in error indicates the last known call in that program. The program source is merged into this panel from the source listing file (PDS) at view time or by the Language Server at abend time.

Use the FIND command on this panel. The syntax is:

F(ind) {variable} blank|previous d|p|blank

where

- *variable* is a Data Division data name, Procedure Division partial statement or a sequence number.
- *blank* searches forward; *previous* or *prev* searches in reverse direction.
- *d* means Data Division; *p* means Procedure Division; a *blank* means either Data Division or Procedure Division (the first occurrence of the variable displays).

In the following panel, the FIND command, f badfield p, searches for 'badfield' in the Procedure Division.

```
----- StarTool DA : COBOL Listing -----

-----
```

You can also point-and-shoot on Perform or Go To statements and DVS uses the LOCATE command to display the Paragraph or Section name referenced.

Option 8 – Data Management Control Blocks and Buffers

The Data Management Control Blocks and Buffers section provides information for every file open at the time of the abend. This section identifies:

- DDNAME
- Data set name
- Device type, volume serial number, disposition and access method
- Data Management Control Block information such as DCB, ACB, IOB, UCB, and so on
- Other information that is based on the type of file access method used
- Current and previous record information, when available. The last record read/written for every open file is viewable. All access methods are supported (BSAM, QSAM, VSAM, BPAM, and so on).

The following panel is the first to display when you choose Option 8. Type an S next to the file for which you want to view detail information.

```

***** Bottom of data *****

```

Option L - Load a source listing to DA

Option L enables you to import a ChangeMan ZMF listing permanently into DA.

There are two main reasons you would want to do this:

- To pre-load a listing to the DBKF for later use in CICS.

- To load a listing from a non-ZMF data set.

NOTE The difference between option C and option L is as follows:

- Option C is a request to view a temporary copy of a listing downloaded from ZMF.
- Option L is a request to download a listing from ZMF and store a permanent copy of the listing in the DA repository.

When DA Batch retrieves a listing, it searches ZMF first. If it cannot find it, or if there is an error, it searches its own repository. This helps ensure that the correct listing is used.

The Source Listing Retrieval Menu gives several ways to load a listing into the DA Language Data Base.

- Loading the Listing from a ZMF Server
- Loading the Listing from a Different Package
- Loading the Listing from a Different ZMF Listing Library
- Loading a Listing from a Different ZMF DSN
- Loading a Listing from a Non-ZMF Listing Source

```
----- ChangeMan ZMF-DA ----- COBOL Source Listing Retrieval Menu -----

                                                               or PF1/HELP for help
Identify the listing to be retrieved and loaded into DA :
    Target module name ==>          (Omit to use abending pgm from dump )

Identify the listing source :
    ZMF package name ==>          (Omit to use abending pgm's package )
    Workload Server SSN ==>        (Omit to use default WorkLoad Server)
    Alternate listing DSN ==>
        Is alternate listing DSN a ZMF library ? ==>   ( Y or N )
        ZMF subsystem ID ==>     (Overrides subsystem ID used at abend time).

Identify the target Language Data Base :
    CICS release number ==>      520 CICS 5.2.0   610 TS 2.1   640 TS 3.1
        - DA-Batch - Leave blank.  530 CICS 5.3.0   620 TS 2.2   650 TS 3.2
        - DA-CICS - Enter a valid release.           630 TS 2.3   660 TS 4.1
                                                670 TS 4.2

Jobcard image : (Note that the input is in both upper and lower case)
    Line 1 ==>
    Line 2 ==>
    Line 3 ==>
```

Loading the Listing from a ZMF Server

To load the ZMF listing for the abending program:

- Leave the **ZMF package name** field blank.
- DA will extract the listing from the ZMF server from which the ZMF data at the time of the abend was extracted.
- You may request communication with an alternate ZMF server by specifying its subsystem identifier in the **ZMF subsystem ID** field.

Loading the Listing from a Different Package

To load the ZMF listing from a different package:

- Specify the requested package name in the **ZMF package name** field.
DA will extract the listing from the ZMF server from which the ZMF data at the time of the abend was extracted.
- You may request communication with an alternate ZMF server by specifying its subsystem identifier in the **ZMF subsystem ID** field.

Loading the Listing from a Different ZMF Listing Library

To load the ZMF listing from an alternate ZMF listing library:

- In the **Alternate listing DSN** field, specify the data set name of the alternate ZMF listing library from which DA can extract the listing.
- In the **Is alternate listing DSN a ZMF library?** field specify Y to indicate that the alternate listing data set is a ZMF library.
DA will extract the listing from the ZMF server from which the ZMF data at the time of the abend was extracted.
- You may request communication with an alternate ZMF server by specifying its subsystem identifier in the **ZMF subsystem ID** field.

Loading a Non-ZMF Listing

To load a non-ZMF listing:

- In the **Alternate listing DSN** field, specify the data set name of the non-ZMF listing data set. If the specified data set is a library, you must enter a member name.
- In the **Is alternate listing DSN a ZMF library?** field specify N to indicate that the alternate listing data set is not a ZMF library.
- Leave the **ZMF package name** and **ZMF subsystem ID** fields blank.
- In the **Target module name** field, specify the name of the program that is to be loaded into the DA Language Data Base.
If this field is blank, DA will use the abending program's name.
- In the **ZMF package name** field, specify the name of the ZMF package from which the listing is to be loaded.

If the **ZMF package name** field is blank and **Alternate listing DSN** is not specified, DA will treat the request as a request to load a ZMF listing and will attempt to extract the package name from the ZMF data in the dump.

- In the **Workload Server SSN** field, specify the name of the DA Workload Server through which you want to communicate with ZMF.
If the **Workload Server SSN** field is blank, the same Workload Server currently in use by your DA-Batch DVS session will be used.

Loading the Listing from a Different ZMF Package

Specifying a DSN in the **Alternate listing DSN** field overrides any listing.

To load the ZMF listing from a different package:

- In the **Alternate listing DSN** field, specify the DSN associated with the package name in the dump's ZMF data.

Loading a Listing from a Different ZMF DSN

To override a ZMF listing DSN:

- Specify the **Alternate listing DSN** and specify Y for the **Is alternate DSN a ZMF library?** field.

Note that no member name is required for a ZMF listing data set.

Loading a Listing from a Non-ZMF Listing Source

To specify a non-ZMF listing source:

- Specify the **Alternate listing DSN** and specify N for the **Is alternate DSN a ZMF library?** field. If the specified data set is a library, you must enter a member name.

The **Alternate listing DSN** field cannot be used in conjunction with the **ZMF package name** field. Use of the ZMF package name field implies that the listing DSN associated with a specific package is to be used.

- If the **Alternate listing DSN** is not enclosed in quotes, the entered DSN will be prefixed with the default DSN prefix value extracted from the ISPF variable ZPREFIX.
- To direct the listing to the DA-CICS target Language Data Base (LDB), in the **CICS release number** field specify one of the listed CICS release numbers.
- To direct the listing to the DA-Batch LDB, leave the **CICS release number** field blank.
- In the **Jobcard image** fields, specify up to 3 lines of text to be used as your jobcard for all submitted jobs. Note that the input is in both upper and lower case.

Multilevel Storage Viewing

The Debugging and Viewing Server (DVS) supports multilevel viewing for the point-and-shoot facility of the **Storage Display** panel. Your current position in the stack of multilevel displays for the **Display Storage** panel is indicated by a new **Display** counter in the upper right corner of the panel.

For example, let's say you use DVS to view a storage region beginning at address X'007EABF8'. The initial display in the multilevel display stack for the **Storage Display** panel is labeled **Display: 1 of 1** (shown in the example in red).

From the first-level **Storage Display** panel above, you use the point-and-shoot facility to select address X'007FC738' at offset zero. The first-level display is pushed down on the display stack and the following newly selected storage area appears in the panel. It is marked in the **Storage Display** counter as **Display: 2 of 2**.

007FC828	0000F0	00000000	00000000	00000000	00000000	* *.	

You can continue to add as many displays as needed to the stack with successive point-and-shoot operations.

To navigate among the saved displays in the multilevel **Display Storage** stack:

- Press LEFT (PF10) to move backward (down) in the stack.
- Press RIGHT (PF11) to move forward (up) in the stack.

The stack contains 50 entries and is circular, with the last item linked to the first. If you continually press LEFT past the start of the stack, you will cycle to the last display and continue backward. If you continually press RIGHT past the end of the stack, you will cycle to the first display and continue forward. If you display more than 50 addresses, the 50th stack entry will be reused for each additional address.

Press END (PF3) to exit the **Display Storage** panel and delete the display stack.

Program Call/Trace Summary for Inactive Modules

The **Program Call/Trace Summary** panel **ESPYIPAA** (Option 5 on the **DVS Selection Menu**) displays all available information for any inactive programs found in the calling chain for the COBOL environment. These programs are marked "inactive" (IA) because they were called at some point during processing but have returned control. Drilldowns are possible on these entries, but the subsequent displays may be limited since storage and call information may have been released or cleared.

The following example shows two inactive modules on panel ESPYIPAA:

```
ESPYIPAA ----- StarTool DA : Program Call / Trace Summary Row 1 to 8 of 8
COMMAND ===> SCROLL ===> CSR

Call Trace Summary and Application Program Attributes

To display a called program's COBOL storage and data, enter "S" into the
selection column and press enter. (Press PF1 for additional help).

Chapter 3

Mini Dump Debug Report

The Mini Dump Debug Report includes only the essential information you need to diagnose and solve an abend. The information is specific to the type of abend, the language of the failing program, and the types of files or databases in use. The report also shows the failing COBOL statement and the contents of the operands.

Mini Dump Sections	56
Mini Dump Report Example	57

Mini Dump Sections

The Mini Dump Debug Report contains the following sections:

- **Job and System Section:** Shows information about the environment of the abending program, including the operating system release level, date and time of the abend, job name, step name, and completion code. See [Job and System Section](#).
- **Diagnostic Section:** Includes a comprehensive explanation of the abend condition, specific information about the fields in the abending statement, and suggested courses of action (whenever possible). See [Diagnostic Section](#).
- **Failing Instruction Section:** Shows the location of the abending statement in the program, the instruction sequence prior to and including the abending instruction, the Program Status Word (PSW), the entry point of the module, the registers that apply to this abend, the location of the last I/O operation or subroutine call (if applicable), the compile date, and the length of the abending program. See [Failing Instruction Section](#).
- **Program Status Word and Register Section:** The Program Status Word and Register Section displays supporting environment data, such as Abend PSW, Program PSW, Load Module Name, Entry Point Address, Instruction Length Code (ILC), Load Point Address, Register contents (in both hex and decimal formats), and Register descriptions. See [Program Status Word and Registers Section](#).
- **Call Trace Section:** Provides a trace of all active programs that were executed using a call or link, and indicates the abending program. The program name, language, compile date, and length are also given for each application program. See [Call Trace Section](#).
- **COBOL Data Section:** Formats program storage for each application program in the calling chain. Included are the Task Global Table (TGT), Dynamic Storage Area (DSA), BLW cells, and BLL cells. See [COBOL Data Section](#).
- **Data Management Control Blocks:** Gives a status of each open file along with formatted current and previous records. See [Data Management Control Blocks Section](#).
- **ChangeMan ZMF Information:** Provides package and component information for programs under ChangeMan ZMF control. See [ChangeMan ZMF Information Section](#).
- **Specialized Database Support:** Provides database support for DB2 and IMS errors if these StarTool DA options are installed on the system.

Mini Dump Report Example

A COBOL S0C7 dump illustrates the different sections of the Mini Dump Report. This dump was generated by a COBOL/390 program running under LE.

Job and System Section

The Job and System Section provides standard information, regardless of the type of dump:

- Date of the error
- StarTool DA version number
- Completion code
- Job name
- Step name
- Job Owner
- Time of the error
- CPU model number
- Operating system release level
- Control Program FMID
- System on which your program was executing
- DFSMS release level
- JES2 release level

```
*****
*   Job Information    *
*****
Completion Code : S0C7-07
Jobname        : WST#9DM2
Stepname       : S010
Job Owner     : WSER21
Time          : 20:42:40
*****
*   System Information  *
*****
CPU MODEL      : 2066
Operating System : MVS/SP 7.0.2
Control Program FMID : HBB7705
SMF System ID   : D002
DFP            : V3.3.2
JES2           : z/OS 1.2
```

Diagnostic Section

The Diagnostic Section provides information to solve the problem. The cause of the error and corrective actions are described. The information varies, depending upon the programming language used and whether the error was external, data related, and so on.

```
*****  
* Diagnostic Section *  
*****
```

SYSTEM ABEND: S0C7

Description: This ABEND is a data exception and can only occur when decimal (packed) instructions are used. One of the following can cause this error:

- 1) The sign or digit codes of one or more bytes manipulated by the packed or CONVERT TO BINARY instructions is invalid for packed decimal use. Packed decimal digits must be in the range 0 through 9, with only the sign digit being a digit in the range A through F.
- 2) Fields in decimal (packed) arithmetic overlap incorrectly.
- 3) A packed decimal multiplicand has too many high-order significant digits.

Possible causes for this abend include:

Subscript error, referenced beyond table
COBOL: working storage not initialized
bad data, should check data for errors
garbage in a field being tested or displayed
move zeroes to group level is display, had
sublevels that were not
period missing after imperative statements
within AT END clause
binary field in an arithmetic operation is not
large enough to accept result

User Action: Correct the format of the data being manipulated by the packed decimal instructions in the program and rerun the job.

Failing Instruction Section

The Failing Instruction Section provides the following information, depending upon the programming language used:

- Statement in error
- Failing Program name and offset
- Instruction sequence prior to and including abending instruction.
- Program's compile and link-edit dates
- Program-ID of compiler/assembler
- Load module name and load library name

NOTE When searching for the abending application load modules in private libraries (non-linklist and non-LPA) that are controlled by LLA (Library Lookaside), DA Batch always locates the most recent copy of the needed member.

- Location of the last I/O operation or subroutine call, if applicable
- Failing COBOL Statement Section - produced for COBOL programs when the source exists in either:
 - The Language Database
 - The Repository Data Set and the execution JCL contains the ESPYCOBL DD.

NOTE If you compile the program in ChangeMan ZMF, it must use the LIST and MAP options to see the failing COBOL statement.

```

Data Management Control Blocks Section

The Data Management Control Blocks Section provides information for every file open at the time of the abend. This section identifies:

- DDNAME
- Data set name
- Device type, volume serial number, disposition and access method
- Data Management Control Block information such as DCB, ACB, IOB, UCB, and so on
- Other information that is based on the type of file access method used
- Current and previous record information (when available)

```

Chapter 4

COBOL Source-Level Support

StarTool DA provides source-level support for debugging COBOL programs. This support is available with both the Mini Dump Debug Report and the Debug/Viewing Server (DVS). StarTool DA allows flexibility by providing production mode and development processing.

The following topics contain more information on StarTool DA source-level support:

Processing Modes	70
Language Environment	72
Debugging and Viewing Server Call/Trace Summary for COBOL Programs	73

Processing Modes

StarTool DA provides both [Production Mode](#) and [Development Mode](#) processing for source-level support when debugging COBOL programs.

NOTE For both modes, you must compile your program with the SOURCE, LIST, MAP, XREF, and NOOFFSET options. For VS-COBOL, use PMAP instead of LIST, and DMAP instead of MAP.

Production Mode

In Production Mode, compile your program using the StarTool DA Language Server. This requires adding two StarTool DA language processor steps to your compile JCL. Sample JCL for these steps is provided on the StarTool DA product tape. Production Mode features include:

- A method for storing source output
- After-the-abend compilation of abended programs
- Source-level analysis
- Access to Working Storage areas using COBOL definitions
- Support for different versions of COBOL

A method for storing source output

The StarTool DA Language Server writes program source to the Language Database. There is an individual VSAM file for each program.

The Language Database is accessed automatically during abend time to produce the Failing Instruction Section of the Mini Dump. It is also accessed by the Debug/Viewing Server during viewing.

After-the-abend compilation of abended programs

The Language Server allows you to generate after-the-abend compiles and use them with the Debug/Viewing Server (DVS). This means that you can smoothly migrate over time to a complete production language database.

Source-level analysis

You can see the source that corresponds to a set of instructions. For example, for a COBOL program and a given hex area in a dump, you can look at the assembler, the COBOL source from the compiler, and the COBOL input to the translator. This source can be an SQL source statement or a simple COBOL verb.

Access to Working Storage areas using COBOL definitions

You can look at the contents of any Working Storage area in the dump using the COBOL definition. The values of Working Storage are frozen at abend time. Uninitialized or invalid data areas, indexes, and subscripts are easily found.

Support for different versions of COBOL

COBOL II, LE/370 (SAA AD/CYCLE COBOL/370), LE/390, and COBOL for MVS are supported.

Development Mode

Using Development Mode in a program development environment is attractive because you need not run the full language database compilation to make the compiler output available for StarTool DA Batch. You use the COBOL compiler output directly by writing the SYSPRINT output to either a sequential or partitioned data set (called a Repository Data Set or RDS). StarTool DA accesses the Repository Data Set for source level debugging with the Mini Dump or the Debug/Viewing Server (DVS).

You must also add the following DD statement to the JCL that executes the program:

```
//ESPYCOBL DD DSN=xxxxxxxx
```

where xxxxxxxx is the name of the sequential or partitioned data set that contains the compiled source listing.

Development Mode supports COBOL II, LE/370 (SAA AD/CYCLE COBOL/370), LE/390, COBOL for MVS, and the old VS-COBOL.

NOTE After-the-abend compiles are not supported in Development Mode.

Differences Between Production and Development

Processing differs between Production Mode and Development Mode at abend time and when using DVS.

At abend time

When Workload Server processing searches for the COBOL source, the following occurs:

- **For a production abend . . .**

The Language Server searches the language database for the matching source, verifies security access, and extracts the source information. If the security check fails, no language database processing occurs. The Language Server provides a return code to the Workload Server and processing continues as if this were a development abend.

If the source is found, and a DVS dump is also being taken, then StarTool DA Batch writes the source to the DataBase Index (DBI). When you view the dump, the system need not search for the source.

In some cases, StarTool DA Batch calls the Language Server again within DVS. Then it places a flag in the DBI header record to identify the type of dump (production or development).

- **For a development abend . . .**

If the execution JCL contains the ESPYCOBL DD statement and the EMCT (MVS Control Table) indicates that a Mini Dump is to be taken, then StarTool DA uses the ESPYCOBL data set as the compile listing repository.

When Using DVS

When you select a DVS dump for viewing and StarTool DA Batch is ready to access the source, the following occurs:

- **For a production dump . . .**

If the source was saved in the DataBase Index as a subset of the header records, then that source is used; otherwise, the Language Server extracts the source information from the language database and writes it to the DataBase Index.

- **For a development dump . . .**

If the source was saved in the DataBase Index as a subset of the header records, then that source is used; otherwise, the repository data set referenced by the ESPYCOBL DD is used. If the source is found, it is then written to the DataBase Index.

Language Environment

StarTool DA Batch can diagnose errors that occur in COBOL programs running under IBM's Language Environment (LE). LE can be configured to trap application errors such that the normal operating system abend and dump services do not receive control. LE thus provides its own condition-handling and error reporting procedures. Part of the condition-handling that LE performs is processing to allow registered Abnormal Termination Exits (ATEs) to receive control in the event of an error.

Invoking StarTool DA-Batch within IBM's Language Environment

Since the StarTool DA install registers the StarTool DA ATE (Abnormal Termination Exit) with LE, StarTool DA receives control from LE for any unhandled condition of severity 2 or greater.

After StarTool DA is installed, COBOL application programs are automatically processed by StarTool DA during abnormal termination processing.

NOTE The LE (Language Environment) installation job must be run when LE maintenance is applied or LE is upgraded.

The installation procedure does not use SMP/E, so you need to perform a manual link-edit of the necessary load modules. The job must be rerun when LE Maintenance is applied or LE is upgraded. Make a backup copy of your production SCEERUN (run-time) library before running the job.

Debugging and Viewing Server Call/Trace Summary for COBOL Programs

The Debugging and Viewing Server (DVS) supports interactive viewing of program working storage and data storage for selected COBOL application programs in the calling chain. This feature is invoked from the **Program Call/Trace Summary** panel in DVS.

```
T----- StarTool DA Program Call / Trace Summary      Row 1 to 4 of 4
COMMAND ===> _____ SCROLL ===> CSR

Call Trace Summary and Application Program Attributes

To display a called program's COBOL storage and data, enter "S" into the
selection column and press enter. (Press PF1 for additional help.)

---Called Pgm--- ---Called Pgm Attributes--- -----Caller----- ---Call---
S Program Load-Mod Comp Date Length Language Load-Mod Program Offset Mode
- -----
-   ESPYCB39  ESPYCB39 04 Aug 2005 002B14 COBOL/ZOS *SYSTEM*          CALL
-   ESPYCB39  ESPYCB39                               CEEBINIT CEEBTOR 0000000 CALL
-   IGZCFCC  IGZCPAC 30 Jun 2003 000E00 HLA ASMBLR ESPYCB39 ESPYCB39 0017EA CALL
-   ESPYCB3B  ESPYCB3B 04 Aug 2005 000674 COBOL/ZOS  IGZCPAC  IGZCFCC 0002CC CALL
***** Bottom of data *****
```

NOTE This panel lists *called* programs on the left and their *calling* programs on the right.

Only called programs that have completed COBOL initialization processing are eligible for viewing. These programs are marked in the panel with an underscore in the **S** column on the far left. Enter an 'S' line command to select the desired called program for viewing.

The **DVS Selection Menu for COBOL Programs** panel (ESPYIPAI) displays. The name of the chosen program appears in the upper left.

```
ESPYIPAI ----- StarTool DA : DVS Selection Menu for COBOL Programs
COMMAND/OPTION ===>

COBOL program name : ESPYCB39           Compile time/date : 2005 Aug 04 10:29:31.98
                                                COBOL compiler    : COBOL/ZOS

COBOL program storage display options
  1 Display Linkage-Section (BLL) storage
  2 Display Working-Storage (BLW) storage
  3 Display program storage

  S Display program source listing

COBOL control block display options
  4 Display COBOL TGT
  5 Display COBOL RunCom
  6 Display COBOL DSA

Enter number of selected option or END(PF3) to exit.
```

The panel allows you to view COBOL Linkage-Section storage areas, Working-Storage-Section storage areas, program storage, the program source code listing, or various COBOL control blocks associated with the selected program. Type the desired option

number at the **COMMAND/OPTION ==>** prompt and press Enter. A list of all storage areas of the selected type is displayed.

For example, if you enter Option 1 on the preceding panel, DVS displays the **COBOL BLL Cell Storage Display** panel (ESPYIPAJ) for your chosen program. All BLL cells associated with the program are listed in display.

```
ESPYIPAJ ----- StarTool DA-Batch COBOL BLL Cell Storage Display
COMMAND ==> _____ SCROLL ==> CSR

Current COBOL program : ESPYCB39

Input   Cell      Address     Length      Description
      00000001  00000000  00000000  -- Storage address is zero
      00000002  1950D478  00000004
      00000003  00000000  00000000  -- Storage address is zero
***** Bottom of data *****
```

To view the contents of a particular storage cell, type an 'S' in the **Input** column to the left of the desired cell number and press Enter. The contents of that cell displays in the DVS **Storage Display** panel.

Chapter 5

DB2 Option

The DB2 option is a separately licensed feature of StarTool DA. It provides access to DB2 related diagnostics information for call-attach programs, TSO-attach programs, and stored procedures.

DB2 Diagnostics	76
SQL Call Summary Panel	76
Plan Information Panel	77
Package Information Panel	80
DBRM Information Panel	84
SQL Statement and Host Variables Panel	86

DB2 Diagnostics

You can view the diagnostics in the Mini Dump report or you can select Option 9, DB2 SQL Information, on the DVS Selection Menu.

```
----- StarTool DA : DVS Selection Menu -----
COMMAND ===>

Title: ABEND S0C7 IN JOB ES992ACC AT 11:36:21 ON SATURDAY, March 15, 2007

1 System and Job Information
2 Diagnostic Section
3 Failing Instruction Section
4 Reg Contents and PSW Info
5 Pgm Call Trace Summary
6 Program Storage
7 Pgm Listing (COBOL Only)
8 Data Mgmt Control Blocks
C ChangeMan ZMF Information
D Program Call/Trace Details
L Load a source listing to DA

Enter Number of selected Option or END(PF3) To EXIT.
```

Abnormal termination of an application occurs as a result of a DB2 SQL call (EXEC SQL) or it can follow an SQL call. In either case, the StarTool DA DB2 Interface (hereafter referred to as the DB2 Interface), references the DB2 application environment at the time of the last SQL call.

To provide access to DB2 call parameters following an unsuccessful SQL call, the application abnormally terminates with a user abend. Use the EXEC SQL WHENEVER clause to do this. A call to module ILBOABN0 when an SQL error is encountered provides a user abend.

The following logic flow summary describes only general flow, is provided for general information purposes only, is *not* provided as program or product documentation, and may be altered or changed at any time without a product update.

SQL Call Summary Panel

In this example, an application is issuing a user abend in response to a negative SQL return code.

```

Field Definitions

DB2 Subsystem Name	JES Subsystem Vector Table Entry name for DB2 subsystem at time of transaction abend.
Plan Name	Identification of the DB2 plan bound to the application program in control at time of transaction abend.
Program Name	Identification of the DBRM library member that contains the statement associated with the last SQL call at time of transaction abend.
Statement Number	Identification of the SQL statement associated with the last SQL call at time of transaction abend.
SQL Timestamp	Identification of the iteration of the DBRM library member that contains the statement associated with the last SQL call at time of transaction abend.
Address of SQL Parmlist	The last SQL call parameter list passed to the DB2 Resource Manager at time of transaction abend.
SQL Communication Area	Formatted display of the SQLCA provided by the DB2 module DSNTIAR. If the DB2 Resource Manager Interface abnormally terminated during processing of an SQL call, a warning message displays because the SQLCA is not available.

Plan Information Panel

The Plan Information follows the SQL Call Summary section.

```

Field Definitions	
Plan - NAME	Name of the application plan.
Creator - CREATOR	Authorization ID of the owner of the table, view, or alias.
Bound by - BOUNDBY	Primary authorization ID of the binder of the plan.
Qualifier - QUALIFIER	Implicit qualifier for the unqualified table, view, index, and alias names in the static SQL statements of the plan.
Bind Date - BOUNDTS	The date on which the plan was last bound, in the form yyymmdd.
Bind Time - BOUNDTS	Time of the BIND in the form hhmmsssth.
Validate - VALIDATE	Whether or not validity checking can be deferred until run time: <ul style="list-style-type: none"> ■ B - All checking must be performed during BIND. ■ R - Validation is done at run time for tables, views, and privileges that do not exist at bind time.
Operative - OPERATIVE	Whether or not the application plan can be allocated: <ul style="list-style-type: none"> ■ N - No; an explicit BIND or REBIND is required before the plan can be allocated. ■ Y - Yes.
Acquire - ACQUIRE	When resources are acquired: <ul style="list-style-type: none"> ■ A - At allocation. ■ U - At first use.

Field Definitions	
Release - RELEASE	When resources are released: <ul style="list-style-type: none">■ C - At commit.■ D - At deallocation.
Current Data - EXPREDICATE	Indicates the CURRENTDATA option when the plan was bound or rebound: <ul style="list-style-type: none">■ B - Data currency is not required for ambiguous cursors. Allow blocking for ambiguous cursors.■ C - Data currency is required for ambiguous cursors. Inhibit blocking for ambiguous cursors.■ N - Blocking is inhibited for ambiguous cursors, but the plan was created before the CURRENTDATA option was available.
Defer Prepare - DEFERPREP	Whether or not the package was last bound with the DEFER(PREPARE) option: <ul style="list-style-type: none">■ N - No■ Y - Yes
Current Server - CURRENTSERVER	Location name specified with the CURRENTSERVER option when the plan was last bound. Blank if none was specified, implying that the first server is the local DB2 subsystem.
Degree - DEGREE	The DEGREE option used when the plan was last bound: <ul style="list-style-type: none">■ ANY - DEGREE(ANY)■ 1 or blank - DEGREE(1). Blank if the plan was migrated.
SQL Rules - SQLRULES	The SQLRULES option used when the plan was last bound: <ul style="list-style-type: none">■ D or blank - SQLRULES(DB2).■ S - SQLRULES(STD).■ blank - A migrated plan.
Disconnect - DISCONNECT	The DISCONNECT option used when the plan was last bound: <ul style="list-style-type: none">■ E or blank - DISCONNECT - (EXPLICIT).■ A - DISCONNECT - (AUTOMATIC).■ C - DISCONNECT - (CONDITIONAL).■ blank - a migrated plan.
Group Member - GROUP_MEMBER	The DB2 data sharing member name of the DB2 subsystem that performed the most recent bind. This column is blank if the DB2 subsystem was not in a DB2 data sharing environment when the bind was performed.
Dynamic Rules - DYNAMICRULES	<ul style="list-style-type: none">■ B - Dynamic SQL statements are handled like static SQL statements at run time.■ blank - Dynamic SQL statements are handled like dynamic SQL statements at run time.

Field Definitions	
Optimize Variable Input Values - REOPTVAR	Whether or not the access path is determined again at execution time using input variable values.
Keep Dynamic - KEEPDYNAMIC	Whether or not prepared dynamic statements are to be purged at each commit point: <ul style="list-style-type: none"> ■ N - The bind option is KEEPDYNAMIC(NO). Prepared dynamic SQL statements are destroyed at commit or rollback. ■ Y - The bind option is KEEPDYNAMIC(YES). Prepared dynamic SQL statements are kept past commit or rollback.

Package Information Panel

Package Information is available in the StarTool DA dump only if the DB2 plan used by the abending program was bound with the PKLIST option.

Field Definitions	
Package Name - NAME	Name of the package.
Collection Id - COLLID	Name of the package collection.

Field Definitions	
Creator - CREATOR	Authorization ID of the creator of the package version.
Owner - OWNER	Authorization ID of the package owner.
Creation Date - TIMESTAMP	Date/timestamp indicating when the package was created.
Creation Time - TIMESTAMP	Date/timestamp indicating when the package was created.
Pre-Compile Date - PCTIMESTAMP	Date (and time) the application program was precompiled, or 0001-01-01-00.00.000000 if the LEVEL precompiler option was used, or if the package came from a non-DB2 location.
Pre-Compile Time - PCTIMESTAMP	Time (and date) the application program was precompiled, or 0001-01-01-00.00.000000 if the LEVEL precompiler option was used, or if the package came from a non-DB2 location.
Qualifier - QUALIFIER	Implicit qualifier for the unqualified table, view, index, and alias names in the static SQL statements of the package.
Valid - VALID	<p>Whether or not the package is valid:</p> <ul style="list-style-type: none"> ■ A – The description of the table or base table of a view referenced by the package was changed by the ALTER TABLE statement. The change did not require the invalidation of the package. ■ H – The description of the table or base table of a view referenced by the package was changed by the ALTER TABLE statement. The change will invalidate the package for a DB2 release prior to Version 5. ■ N – No ■ Y – Yes
Operative - OPERATIVE	<p>Whether or not the package can be allocated:</p> <ul style="list-style-type: none"> ■ N – No; an explicit BIND or REBIND is required before the package can be allocated. ■ Y – Yes
Validate - VALIDATE	<p>Whether or not validity checking can be deferred until run time:</p> <ul style="list-style-type: none"> ■ B – All checking must be performed at bind time. ■ R – Validation is done at run time for tables, views, and privileges that do not exist at bind time.

Field Definitions	
Isolation - ISOLATION	Isolation level when the package was last bound or rebound: <ul style="list-style-type: none">■ R – RR (repeatable read)■ T – RS (read stability)■ S – CS (cursor stability)■ U – UR (uncommitted read)■ blank – Not specified; at the level specified for the plan executing the package
Comma - COMMA	Decimal point representation for SQL statements in package: <ul style="list-style-type: none">■ N – Period■ Y – Comma
Quote - QUOTE	SQL string delimiter for SQL statements in the package: <ul style="list-style-type: none">■ N – Apostrophe■ Y – Quotation mark
Host Language - HOSTLANG	Host language for the package's DBRM: <ul style="list-style-type: none">■ B – Package Information is available in the StarTool DA dump only if the DB2 plan used by the abending program was bound with the PKLIST option Assembler language.■ C – OS/VS COBOL■ D – C■ F – FORTRAN■ P – PL/I■ 2 – VS COBOL II or IBM COBOL Release 1 (formerly called COBOL/370)■ 3 – IBM COBOL (Release 2 or subsequent releases)■ 4 – C++■ blank – For remotely bound packages
Mixed - MIXED	Indicates whether or not mixed data was in effect when the package's program was precompiled: <ul style="list-style-type: none">■ N – No■ Y – YES
Dec31 - DEC31	Indicates whether or not DEC31 was in effect when the package's program was precompiled (for more on when DEC31 is in effect, see " <i>Arithmetic with Two Decimal Operands</i> " in topic 3.14.6 in the DB2 SQL Reference): <ul style="list-style-type: none">■ N - No■ Y - YES

Field Definitions	
Defer Prepare - DEFERPREP	<p>Indicates the CURRENTDATA option when the package was bound or rebound:</p> <ul style="list-style-type: none"> ■ A – Data currency is required for all cursors. Inhibit blocking for all cursors. ■ B – Data currency is not required for ambiguous cursors. ■ C – Data currency is required for ambiguous cursors. ■ blank – The package was created before the CURRENT DATA option was available.
Degree - DEGREE	<p>The DEGREE option used when the package was last bound:</p> <ul style="list-style-type: none"> ■ ANY – DEGREE(ANY) ■ 1 or blank – EGREE(1). Blank if the package was migrated.
Version - VERSION	Version identifier for the package
DBRM Library - PDSNAME	<p>For a locally bound package, the name of the PDS (library) in which the package's DBRM is a member. For a locally copied package, the value in SYSPACKAGE.PDSNAME for the source package. Otherwise, the product signature of the bind requester followed by one of the following:</p> <ul style="list-style-type: none"> ■ The requester's location name if the product is DB2. ■ Otherwise, the requester's LU name enclosed in angle brackets; for example, <LUQLDS>.
Group Member - GROUP_MEMBER	The DB2 data sharing member name of the DB2 subsystem that performed the most recent bind. This column is blank if the DB2 subsystem was not in a DB2 data sharing environment when the bind was performed.
Dynamic Rules - DYNAMICRULES	<ul style="list-style-type: none"> ■ B – Dynamic SQL statements are handled like static SQL statements at run time. ■ R – Dynamic SQL statements are handled like dynamic SQL statements at run time. ■ blank – DYNAMICRULES is not specified for the package. The package uses the DYNAMICRULES value of the plan to which the package is appended at execution time.
Optimize Input Variable Values - REOPTVAR	<p>Whether or not the access path is determined again at execution time using input variable values:</p> <ul style="list-style-type: none"> ■ N – Bind option NOREOPT(VARS) indicates that the access path is determined at bind time. ■ Y – Bind option REOPT(VARS) indicates that the access path is determined at execution time for SQL statements with variable values.

Field Definitions	
Keep Dynamic - KEEPDYNAMIC	Whether or not prepared dynamic statements are to be purged at each commit point: <ul style="list-style-type: none"> ■ N – The bind option is KEEPDYNAMIC(NO). Prepared dynamic SQL statements are destroyed at commit. ■ Y – The bind option is KEEPDYNAMIC(YES). Prepared dynamic SQL statements are kept past commit.
Defer Prepare - DEFERPREPARE	Whether or not PREPARE processing is deferred until OPEN is executed: <ul style="list-style-type: none"> ■ N – Bind option NODEFER(PREPARE) indicates that PREPARE processing is not deferred until OPEN is executed. ■ Y – Bind option DEFER(PREPARE) indicates that PREPARE processing is deferred until OPEN is executed. ■ blank – Bind option not specified for the package. It is inherited from the plan.

DBRM Information Panel

NOTE DBRM Information is available in the StarTool DA dump only if the DB2 plan used by the abending program was bound with the MEMBER option.

```

Name (WS-SYSPACKAGE.WS-SYSPACKAGE-QUALIFIER)		
Type (CHAR)	Length(8)	Address(0000865E)
Value (SPANDA)		

Field Definitions

Name	Name of host variable.
Type	Type of host variable: character, packed, or binary.
Length	Length of host variable.
Address	Address of host variable.
Value	Value of host variable. For character type host variables, a maximum of seventy-two characters display. Using the Point-and -Shoot feature on the host variable address, the complete value displays.

Chapter 6

IMS Option

The IMS option is a separately licensed feature of StarTool DA. Use this option to analyze IMS application program dumps. It provides IMS related diagnostic information that you can view in the IMS Data section of the Mini Dump report or by choosing Option 10 from the DVS Selection Menu; both ways provide the same information.

What is Supported	90
Information Displayed	91
Viewing a Dump with DVS	92

What is Supported

The following table shows what region types, PCBs, PSBGEN languages, and DL/I call languages are supported.

For this category	This is supported
Region types	<ul style="list-style-type: none"> ■ DL/I Batch ■ BMP ■ MPP ■ IFP (Fast Path) ■ DBB
PCBs	<ul style="list-style-type: none"> ■ TP (I/O and Alternate) ■ DB ■ Fast Path (MSDB & DEDB) ■ GSAM
PSBGEN languages	<ul style="list-style-type: none"> ■ ASSEMBLER ■ COBOL ■ FORTRAN ■ PASCAL ■ PL/I
DL/I-Call language interfaces	<ul style="list-style-type: none"> ■ ASSEMBLER ■ COBOL ■ FORTRAN ■ PASCAL ■ PL/I ■ AIB

Information Displayed

The following table shows what information displays.

For this category	The following information displays
DLI, BMP, MPP, IFP, and DBB region types	<ul style="list-style-type: none"> ■ Job Name ■ Step Name ■ IMS Release ■ IMS Subsystem Name ■ Region Type ■ PSB Name ■ PSBGEN Language Option ■ Last DL/I-Call Language Interface ■ Application Program Name ■ Application Program Input Parameter List
TP, DB, and GSAM PCBs	<ul style="list-style-type: none"> ■ PCB Address ■ PCB Type ■ PCB Name ■ PCB Relative Number ■ Relocated PCB Address (for BMP region type) ■ Indication of last DL/I call using this PCB ■ Indication of LIST=NO option in PCBGEN/PSBGEN (for BMP region type) ■ Status Code ■ Status Code Explanation for a non-blank status code ■ Application Programmer Response for a non-blank status code
TP PCB	<ul style="list-style-type: none"> ■ Terminal Symbolic Name ■ Default Formatting Module Name ■ User ID ■ Group Name

For this category	The following information displays
DB PCB	<ul style="list-style-type: none"> ■ DBD Name ■ Processing Option ■ Number of Sensitive Segments ■ Level Feedback ■ Segment Name Feedback ■ Key Feedback Area ■ Segment Data (for DL/I Batch and DBB region types) ■ JCB DL/I-Call Trace Entries in FIFO (First-In-First-Out) order (for DL/I Batch and DBB region types)
GSAM PCB	<ul style="list-style-type: none"> ■ DBD Name ■ Processing Option ■ DDNAME ■ Data Set Organization ■ Data Set Name(s) & Volume Serial Number(s) ■ User I/O Area
Last DL/I-Call PCB	<ul style="list-style-type: none"> ■ Last DL/I-Call Language Interface ■ Last DL/I-Call User ParmList address, module name, and offset ■ Last DL/I-Call User Parm addresses, module names, and offsets ■ Last DL/I-Call Function Code and its address

NOTE Any reference to language support for the IMS Option is limited to displaying information such as control block contents, parameter addresses, parameter values, and so on.

There is no point-and-shoot support for high-level language listings in the IMS Option; point-and-shoot is available only for storage addresses in the dump.

Viewing a Dump with DVS

This section describes the features and diagnostic information available for an IMS DVS dump.

NOTE The information available with DVS is the same as the IMS Data section of the Mini Dump report. With DVS, you can use the Point-and-Shoot feature to display storage locations.

To access IMS dump information using DVS, choose Option 10 from the DVS Selection Menu.

```
----- StarTool DA : DVS Selection Menu -----
COMMAND ===>

Title: ABEND S0C1 IN JOB TEST1234 AT 15:11:22 ON SATURDAY, March 15, 2007

1 System and Job Information
2 Diagnostic Section
3 Failing Instruction Section
4 Reg Contents and PSW Info
5 Pgm Call Trace Summary
6 Program Storage
7 Pgm Listing (COBOL Only)
8 Data Mgmt Control Blocks
10 IMS Information
C ChangeMan ZMF Information
D Program Call/Trace Details
L Load a source listing to DA

Enter Number of selected Option or END(PF3) To EXIT.
```

NOTE Option 10 may not be on the menu if IMS primary modules (such as DFSRRC00 and DFSVC000) are not present in the dump or are not fully initialized when the error occurs.

This is an example of the first screen to appear for a DL/I dump.

```
----- StarTool DA : Job IMS Listing -----
COMMAND ===> SCROLL ===> PAGE

Selected Job= TEST1234
Program= IMSLINK9

----- I M S   D A T A -----

Job Name = TEST1234

NOTE In the Last DL/I-Call Language Interface field, the value displays as follows for these conditions:

- When using the Language Environment interface, the value is Unknown.
- When using the C language interface, the value is Assembler.

Point-and-Shoot

Use Point-and-Shoot with the IMS Option to display storage locations. To use this feature, place the cursor on any line with an 8-byte hexadecimal address preceded by 'at' or 'to', and press Enter.

The following example shows information for the I/O PCB. To get to the storage location, place the cursor anywhere on the line containing the statement I/O PCB at x'000310BC', and press Enter.

```

NOTE When you go to the Storage Display screen using Point-and-Shoot, you cannot scroll backwards to an address prior to the Start Address. To go to a prior address, type the following command on the command line:

L xxxxxxxx

where xxxxxxxx is a 1- to 8-byte hexadecimal address.

Relocated PCBs

The following example shows a PCB that was relocated by IMS. If you place the cursor on the line containing the statement DB PCB at x'0000DB24' and press Enter, you will get an error message indicating that the storage location is not in the dump, or find that the location exists but has unexpected data. This can happen if IMS releases the control block and the storage is then allocated to another program. To get to the relocated storage location, place the cursor anywhere on the line containing the statement relocated to x'00015D6C', and press Enter.

```

Chapter 7

ChangeMan ZMF Option

If StarTool DA intercepts an abending routine that is controlled by ChangeMan ZMF, StarTool DA accesses ChangeMan ZMF and retrieves data for the package that the abending job participates in.

NOTE Before you can use this feature, you need to configure ChangeMan ZMF and StarTool DA as described in the *StarTool DA Installation Guide*. Remember to initialize the Serena® StarTool® DA Workload Server (WLS) after starting TCP/IP and the ChangeMan ZMF subsystem to which you want to connect.

Selecting the Dump to Analyze	100
General Package Information Panel	101
Load Component Information Panel	102
History Information Panel	103
Display ChangeMan Source Listings	104

Selecting the Dump to Analyze

To analyze a dump for a abended routine that was controlled by ChangeMan ZMF:

- 1 Access the DVS Selection Menu panel.
- 2 Select a dump, then press Enter.

If the dump was a transaction dump, the DVS Selection Menu screen displays.

```
----- StarTool DA : DVS Selection Menu -----
COMMAND ==>

Title: ABEND S0C1 IN JOB WSER2769 AT 10:09:01 ON TUESDAY , JUNE 29, 2007

PACKAGE TYPE      ==> PLANNED
PACKAGE TIME SPAN ==> PERM
UNPLANNED REASON CODE ==>
TEMPORARY CHANGE DURATION ==>
```

This table describes the fields on the General Package Information panel.

Field	Description
Package Title	The title of the change package.
Application	The application associated with the change package.
Requester's Name	The name of the person who requested the information.
Requester's Phone	The telephone number, or extension, of the requester.
Work Request ID	The Work Request ID.
Department	The requester's department.

Field	Description
Package Level	<p>Can be one of the following:</p> <p>1 (Simple). The change package contains a change that is unrelated to any other change package. This level does not affect any other application, nor does it require changes to software or operational procedures.</p> <p>2 (Complex). The parent for two or more participating change packages that have interdependent changes to software or operational procedures. Complex change packages contain only control, general information, and a list of participating packages. There are no staging libraries associated with super/complex change packages. Remote sites and the installation dates for each site are tracked in the participating change packages.</p> <p>3 (Super). The parent for two or more participating change packages that contain major changes to several applications. Super change packages contain only control, general information, and a list of the participating packages. There are no staging libraries associated with super/complex change packages. Remote sites and the installation dates for each site are tracked in the participating change packages.</p> <p>4 (Participating). The change package is related to one or more other participating change packages.</p>
Package Type	<p>Planned – Indicates that the packages are scheduled changes that follow the established application rules.</p> <p>Unplanned – Indicates that the packages are unscheduled changes, possibly an emergency fix. Emergency packages bypass some of the application rules and have a separate approval list.</p>
Package Time Span	<p>Permanent – Indicates that the packages are scheduled changes that update baseline or production libraries. Permanent changes are either planned or unplanned. This is the normal way to install changes.</p> <p>Temporary – Changes that run for a predetermined length of time. Once that time expires, ChangeMan ZMF automatically deletes the change. Temporary changes do not update baseline or production libraries. These changes are installed into a static override library. Temporary changes are either planned or unplanned.</p>
Unplanned Reason Code	The reason for the package being unplanned.
Temporary Change Duration	The number of days that the change is to remain in effect.

Load Component Information Panel

The Load Component Information panel displays ChangeMan ZMF information about the component that abended, such as source module name and last time the code was altered.

To access the Load Component Information panel, select option 2 on the main ChangeMan ZMF Information panel.

----- StarTool DA : ChangeMan ZMF Information -----

```

This table describes the fields on the History Information panel.

Package ID	Displays the package ID for the package that contains the component which abended..
Status	Displays the status of the package.
Promotion	Level that the component resides after this action.
VV.MM	The version and modification number for the component following the IBM standards (mm starts at 01, increments to 99; vv starts at 01, increments to 99, and recycles to 01). The first time the component is processed by ChangeMan ZMF the vv.mm is 01.01. Each successive stage request (in the same change package) increments the mm portion (for example, 01.02, 01.03). The next package using the component causes the vv portion to be incremented (02.01).
Last Action	The date and time of the last change to the component.
Size	The size of the component.
PROCNAME	The procedure that compiled and link-edited the source file.
ID	The TSO ID of the user who performed the last action on the component.

Display ChangeMan Source Listings

The ChangeMan Source Listing panel displays the listing found in ChangeMan ZMF for the abended program.

To access the ChangeMan Source Listing panel, select option S on the main ChangeMan ZMF Information panel.

Logic for Retrieving Source Code from ChangeMan

StarTool DA uses the following logic to retrieve source code of abending programs that are controlled by ChangeMan ZMF:

- 1** StarTool DA tries to access the source in the ChangeMan ZMF staging library.
- 2** If staging library doesn't exist, StarTool DA checks if the program's package has been baselined.
- 3** If the package is baselined, StarTool DA retrieves the source code from the baseline library.

located ESxxSPRM member in the customer SHPLIB (with the ESxx value being replaced with their DA configuration identifier). See the StarTool DA Installation Guide for information on changing this parameter.

Chapter 8

Dump Examples

Here are some examples of Mini Dump Reports.

SOCB with Language Server (COBOL II)	108
S130 Abend	112
S813 (Diagnostic Section Only)	115
SOC4 - 11 (Storage Not Available)	116
SOC4 - 4 (Low Storage Access)	118
SOC4 - 4 (Storage Key Mismatch)	119
SOC4 - 4 (Storage Protected)	120
DB2 Example	121

SOCB with Language Server (COBOL II)

The following Mini Dump Debug Report is generated when a COBOL-II program abends with an SOCB. The Language Server identifies the failing machine instruction, content of error operand and source COBOL statement. (No DCBs or ACBs are printed since this program does not contain files).

S130 Abend

The following Mini Dump Debug Report (only a portion is shown) is generated when an S130 type abend is encountered.

```
*****
*      Job Information      *
*****
Completion Code : S130
Jobname        : WST006BR
Stepname        : ESPYE

DFSMS          : V1.4.0
JES2           : OS 2.5.0
-----
*****
```

SYSTEM ABEND: S130

Description: A DEQ was issued for a resource name that had not previously been ENQ'ed by the task that issued the DEQ. This is probably due to a logic error in the program that issued the DEQ.

User Action: Make sure your program owns a resource before DEQ'ing it, or use the RET=HAVE keyword on the DEQ macro. If you are analyzing a dump of this abend, the UNIQUE-3 column in the trace table entry for the SVC 30 or SVC 38 will contain the address of the DEQ parm list. Check all addresses in the parm list for correct format and usage.

```
*****
*      Failing Instruction Section    *
*****
```

The Failing Instruction is in Program (CSECT):

ISGGABND At Offset +X'00130A'

The failing instruction is:

```
====> SVC 13 <=====
```

```
*****
* This is a code S130 Abend. It is the result of an error in issuing a(n) DEQ SVC. *
* The SVC that caused the abend is in LMOD TIMEFMT6, CSECT TIMEFMT6, at offset X'000B20. *
* The following code reflects the sequence of instructions leading up to the failing SVC Call. *
*****
```

* Instruction sequence prior to and including the failing SVC Call. *

TIMEFMT6 was compiled on 15 Sep 2002 By PGMD 5696-234-00, V 0.1 M 02 (HLA ASMLB)
It is a CSECT in Load Module TIMEFMT6
The module was loaded from STEPLIB Library WST006.LOADLIB

It was Link Edited on 15 Sep 2002

S813 (Diagnostic Section Only)

In this example, the file name in the JCL did not match the name on the tape label. See the Action item at the end of this example for the resolution to this problem.

Completion Code - S813 - 04

```
*****  
* Diagnostic Section *  
*****
```

SYSTEM ABEND: S813 -04

Description: The error happened when an OPEN macro was issued for a data set on tape. This abend is accompanied by message IEC149I, which explains the return code issued with the ABEND code.

User Action: This ABEND usually indicates a mismatch between the data set name specified in the JCL and the data set name in the tape label for the data set. Refer to message IEC149I for a complete description of the ABEND return code.

*** Additional information for this item appears below: ***

Message Format: IEC149I 813-rc,mod,jjj,sss,ddn{-#},ser,DSN

Example: IEC149I 813-04,IFG0032,Jobname,Stepn,DDname,CART01,DSName

Description: An error occurred during OPEN processing for a data set on a magnetic tape. The 'rc' value in the message is a return code that describes the error in detail. Possible 'rc' values and their meanings are provided below.

For rc=04, an OPEN was issued for a data set on magnetic tape, but the data set name in the tape's header label did not match the data set name in the JCL. If the header label does match the JCL data set name, verify that the JFCB was not modified incorrectly. This message can also occur if the first file of a magnetic tape does not exist (that is, the tape has a volume label and a dummy header).

User Action: Ensure that the data set name and volume serial number on the DD statement are correct; if they are, verify that the JFCB was not modified incorrectly by the program that issued the OPEN.

```
*****  
* Additional ABEND Information *  
*****
```

Abending DDNAME is TAPE

DSNAME from DD card and DSNAME on Tape
(VOLSER=HDS260) do not agree.
DSNAMES from DD card and Tape Label:

DD CARD: SP1SYS.DUMP01
TAPE : TWORK.Y2K.INSTALL

```
*****  
* NOTE: Only the last 17 bytes of the *  
* TAPE label and the DD DSN are compared.*  
*****
```

Action: Change the DD CARD DSN to match the TAPE DSN - or
Specify the TAPE VOLSER whose DSN matches the DD CARD DSN.

SOC4 - 11 (Storage Not Available)

In this abbreviated example, an assembler program executing in a subspace referred to storage that was not available to it. A program in a subspace can only refer to storage in the subspace or storage common to all subspaces (reason code 10 or 11). The assembler failing operand is identified and tells you the reason the operand failed. StarTool DA provided critical information.

Completion Code - SOC4 - 11

SYSTEM ABEND: SOC4

* Diagnostic Section *

Description: This ABEND is caused by a hardware detected virtual address translation error, or a storage protection violation. One of the following is true:

- The requested referenced was never allocated (i.e., never GETMAIN'ed - reason code 10 or 11)
- this is a page-translation or segment-translation exception.
- The requested virtual storage was paged out and the routine that referenced it was disabled for I/O interrupts (reason code 11 with disabled PSW).
- A program executing in a subspace referred to storage that was not available to it. A program in a subspace can only refer to storage in the subspace or storage common to all subspaces (reason code 10 or 11).

User Action: Correct the program logic error that generated the invalid address or storage reference. When analyzing the dump, remember that the PSW saved when an 0C4 abend occurs may point at the failing instruction or it may point at the next instruction after the failing instruction.

Check to ensure that your program is obtaining, using, and freeing storage properly. Moving data to a zero address or to an address less than 512 (decimal) is a very frequent cause of this abend.

Possible causes for this abend include:

COBOL: Invalid address was referenced due to subscript error or bad parameter passed
In group move, receiving record variable length defined incorrectly
Tried moving variable length record that was larger than target field size
Tried to read or write a file which was not open
Used DD DUMMY with logic that moves high values to FD
Tried to call within COBOL SORT I/O procedure
Tried to "goback" in the SORT output procedure

SOC4 - 4 (Low Storage Access)

In this abbreviated example, an assembler program tried to store into a low storage address. Moving/storing data to an address less than 512 (decimal) is a frequent cause of this abend. The assembler failing operand is identified and tells you the reason the operand failed.

Completion Code - SOC4 - 04

```
*****
*   Diagnostic Section   *
*****
```

SYSTEM ABEND: SOC4

Description: This ABEND is caused by a hardware detected virtual address translation error, or a storage protection violation. One of the following is true:

- The protect key in the program PSW does not match the protect key of an instruction operand or storage area. References to pages protected with the PGSER PROTECT service or specified shared with a read-only view to the IARVSETR service can cause this exception.
- this is a protection exception (reason code 4).

User Action: Correct the program logic error that generated the invalid address or storage reference. When analyzing the dump, remember that the PSW saved when an 0C4 abend occurs may point at the failing instruction or it may point at the next instruction after the failing instruction.

Check to ensure that your program is obtaining, using, and freeing storage properly. Moving data to a zero address or to an address less than 512 (decimal) is a very frequent cause of this abend.

Chapter 9

Troubleshooting

The following describes typical troubleshooting situations and solutions.

Missing Dump Display Options	124
COBOL Source Display	124
ChangeMan ZMF Integration	125

Missing Dump Display Options

No Debugging and Viewing Server Dumps Available

If the Debug/Viewing Server is not installed at your site, output is written to the //SYSUDUMP DD, or if present, to the //ESPYDUMP DD statement in the execution JCL. You can view Mini Dump reports as part of your job output from the System Display and Search Facility (SDSF).

No Mini Dump Debugging Reports Available

Put a //SYSUDUMP DD statement in the program execution JCL. If you have a //SYSUDUMP DD statement and are not getting Mini Dump report output, contact your installer. Your installer did not set up your prefix.

COBOL Source Display

No COBOL source in Mini Dump or Debug/Viewing Server

If you have a //SYSUDUMP DD statement and are not getting any COBOL source in either the Mini Dump or within the Debug/Viewing Server, the following two scenarios exist:

If this is a production dump:

- 1 You must recompile the program with the correct PROC that contains the Language Server (which stores the source within the Language Data Base) and look at the dump again using the Debug/Viewing Server.
- 2 If you still cannot view the COBOL source, do one of the following:
 - Contact your security administrator and explain that you are supposed to have access to this production program's source code within the Language Data Base.
 - Check if you are using the correct Language Data Base. You can change the Language Data Base you are using on the first Dump/Viewer Server panel by tabbing to Current Source Listing Directory and changing the Language Data Base name.

If this is a testing dump:

- 1 The Repository Data Set (RDS) must contain your COBOL source. If it does not, then recompile your program using the correct options: SOURCE, LIST, MAP, XREF, NOOFFSET. For VS-COBOL, use PMAP instead of LIST and DMAP instead of MAP. The SYSPRINT DD in the compile step must point to the RDS. Also, make sure that you included an //ESPYCOBL DD statement in the execution JCL of the abending program.
- 2 Rerun the test job and look at the dump again using the Debug/Viewing Server (DVS).

- 3** If you still cannot view the COBOL source, your invocation of the Debug/Viewing Server is not allocating your RDS. Contact your installer and explain that you need to have this RDS pre-allocated when you are doing testing/development.

Wrong Version of COBOL Source in the Debug/Viewing Server

If the Debug/Viewing Server is installed and you have chosen to use the Repository Data Set (testing mode) to retain your source COBOL, you must include the following DD statement in the abending program's JCL:

```
//ESPYCOBL DD DSN=xxxxxxx,DISP=SHR
```

where xxxxxxxx is the name of the partitioned or sequential data set used for your Repository Data Set.

Otherwise, the system assumes that you put the Language Server output to the production Language Data Base.

Failing COBOL Statement Not Displayed

If the program is compiled within ChangeMan ZMF, it must use the LIST and MAP options to see the failing COBOL statement.

ChangeMan ZMF Integration

StarTool DA Fails to Connect with ChangeMan ZMF

If either TCP/IP or the ChangeMan ZMF started task is not already running when you start the Serena® StarTool® DA Workload Server (WLS), [product family] will be unable to connect to ZMF. If this occurs, you should start TCP/IP or ZMF, then issue the following command to initiate a connection:

```
/F ESxxWLS,CMN_SSID=ZMFSubsysID
```

where

ESxxWLS = WLS name assigned during installation of Serena® StarTool® DA

ZMFSubsysID = one-character ID of the particular ChangeMan ZMF subsystem to which you want to connect

To avoid this problem, you should remember to start both TCP/IP and the ZMF subsystem desired before you initialize the Serena® StarTool® DA Workload Server.
