Micro Focus Enterprise Developer 6.0 for Eclipse Release Notes

These release notes contain information that might not appear in the Help. Read them in their entirety before you install the product.

Note:

- This document contains a number of links to external Web sites. Micro Focus cannot be responsible for the contents of the Web site or for the contents of any site to which it might link. Web sites by their nature can change very rapidly and although we try to keep our links up-to-date, we cannot guarantee that they will always work as expected.
- Check the *Product Documentation* section of the [Micro Focus SupportLine Documentation Web site](#) for any updates to the documentation which might have been uploaded.

Product Overview

Note:

- The Application Workflow Manager is available within all Enterprise Developer variants and provides all the capabilities and tools to develop and maintain Application Workflow models. These models allow you to integrate tools and processes directly into Enterprise Developer. You can use the Application Workflow Manager with the following products:
 - Enterprise Developer - the Enterprise Developer setup file automatically installs the Application Workflow Manager.
 - IBM Rational Developer for System z (IDz) - see *Installing Application Workflow Manager into Rational Developer for System z (IDz)* in the installation instructions. This requires that Enterprise Developer Connect is installed and licensed.

Upgrading from earlier Micro Focus products

Note: Windows-only.

This version of your product is dependent on a later version of the Microsoft C run-time system than earlier Micro Focus products. This means that COBOL executables (.exe) built with a version earlier than 4.0 might not be compatible with the current version of the run-time products. If the behavior of your application changes with the current version, we strongly recommend that you relink the main executable with the current version. This will ensure that the COBOL run-time system fully handles any run-time error conditions that might occur.

A new executable that is fully compatible with the current version can be produced without recompiling the application, as long as the original object code is available and it is relinked with the current version.

To allow your executables to benefit from the product's latest programming and performance enhancements, we recommend a full recompilation of your source code.

If you are using Eclipse, Enterprise Developer can automatically relink existing projects created with Enterprise Developer earlier than 4.0 that have executable link artefacts. Eclipse displays a warning in the **Problems** view that the project requires relinking. It then offers a Quick Fix action for you to execute that will link your project with the most recent version of the Run-Time System.

What's New

This *What's New?* document covers some of the new features and functions in the latest release of the Micro Focus Enterprise Product Suite. Updates apply to the following products:

- **Micro Focus Enterprise Developer** which provides a contemporary development suite for developing and maintaining mainframe applications, whether the target deployment is on or off the mainframe.
- **Micro Focus Enterprise Test Server** which provides a comprehensive test platform that takes advantage of low cost processing power on Windows environments, to supply scalable capacity for testing z/OS applications without consuming z/OS resources.
- **Micro Focus Enterprise Server** which provides the execution environment to deploy fit-for-purpose mainframe workload on Linux, UNIX and Windows (LUW) environments on IBM LinuxONE (IFLs), standalone servers, virtual servers, or the Cloud.
- **Micro Focus Enterprise Server for .NET** which provides the execution and modernization platform to deploy fit-for-purpose mainframe workload on a scale-out .NET infrastructure and the Azure Cloud.

This document helps you to quickly understand the new capabilities within the 6.0 release.

Enhancements are available in the following areas:

- [Application Workflow Manager](#)
- [Building Applications](#)
- [COBOL Application Console Size](#)
- [COBOL Language Enhancements](#)
- [Code Analysis](#)
- [Code Analyzer Refactoring](#)

Application Workflow Manager

[Back to Top](#)

Improvements have been made in the following areas:

- REST modelling - the REST function package now supports the following:
 - HTML formatted text fields.
 - Copying and pasting of JSON format template into a JSON structured file descriptor in the AWM model editor.
 - Specify a general status code handling, which is applicable for all tools from the REST function package.
 - Handling loops when specifying a status code handler.
 - Uploading and downloading text files to and from a REST based application.
 - Automatic retrieving of valid values for a dialog input field without the need to click **Retrieve**.
 - Auto-completion in dialog input fields.
 - Specify clearing dependencies between dialog input fields.
- Local Java development - the following features supporting local projects for Java development have been added:
 - A Java function package with the corresponding property, element types, and tools
 - A sample AWM model for local Java development
 - The function package developer guide now provides more details.
 - AWM extension templates are now available
 - AWM model editor improvements:
 - The AWM model properties now only display the relevant attributes in the **Properties** view.
 - Auto-completion of fields which enable you to specify property references.
 - The **Used by** dialog now displays property reference usage.

Building Applications

[Back to Top](#)

This release includes the following new functionality:

- Maven build support - you can use the Apache Maven support in Eclipse to build COBOL JVM projects and COBOL JVM Unit Test projects.

COBOL Application Console Size

[Back to Top](#)

The maximum console size of a COBOL application has increased. It can now be 255 lines by 255 columns, configurable using the `screen_lines` and `screen_cols` run-time tunables.

COBOL Language Enhancements

[Back to Top](#)

The following enhancements are available:

- **Enterprise COBOL 6.2 Update** - new syntax, library routines, and the respective analysis tooling are available for compatibility with IBM's Enterprise COBOL 6.2 Update:
 - New intrinsic functions are supported: BIT-OF, BIT-TO-CHAR, BYTE-LENGTH, HEX-OF, HEX-TO-CHAR, NUMVAL-F, TEST-NUMVAL, TEST-NUMVAL-C, TEST-NUMVAL-F, and TRIM
 - A number of intrinsic functions now support national data (especially surrogate pairs): REVERSE, ULENGTH, UPOS, USUBSTR, USUPPLEMENTARY, UVALID, and UWIDTH.
 - A LOC phrase has been added to the ALLOCATE statement to define whether memory is allocated above or below the 16MB line.
- **CONSTANT qualifier** - it is now possible to define data items as constants. This improves the code readability and usability, and helps detect programming errors. The ability to create constant items is already in .NET COBOL and JVM COBOL, and many other languages.
- **Local variable declarations in native COBOL** - it is now possible to declare data items inline in the code and not only in a separate DATA DIVISION. This provides better locality of data, making the source code easier to reason about.
- **Native data type to hold strings of utf-8 characters** - in native COBOL, support is now available for the PIC U data type as introduced by IBM in Enterprise COBOL version 6.3. Direct support is available for utf-8 data.
- **Performance improvements** - this release provides various performance improvements, most significantly on 32-bit Intel x86 platforms. When using the highest optimization level, opt(4), the performance of native code generated by the COBOL Compiler has improved. A number of cases are affected, most particularly those where it is beneficial to locate PERFORM ranges inline.

Code Analysis

[Back to Top](#)

Support is provided in Enterprise Developer for accessing the Application Analysis Server which is part of the Micro Focus Enterprise Analyzer and Micro Focus COBOL Analyzer products.

If you have one of these products installed, you can connect to the Application Analysis Server from Server Explorer and access the Enterprise Analyzer web client. Enterprise Analyzer web client provides quick searches for repository objects, detailed code searches, diagrams, reports, and data item impact analysis and other features such as viewing and editing of business rules (separate license required).

Code Analyzer Refactoring

[Back to Top](#)

Support is now available for extracting program logic from COBOL code and moving it to a new program. The following commands are available from the editor context menu:

- Create program from Section
- Create program from Computation
- Create program from Condition

In Eclipse, you can now refactor your code using the **Extract to Section** command available from the **Refactor** menu.

Compiler Directives

[Back to Top](#)

The following Compiler directives are new in this release:

- DISPLAY-AT - specifies a default foreground and background color for DISPLAY AT and ACCEPT AT statements that do not specify any color attributes.
- DPC-IN-DATA - controls whether the DECIMAL-POINT IS COMMA clause (if specified) is applied to the output from the XML GENERATE and JSON GENERATE statements.
- ILCONDITIONPARAM - switched on by default. Enables the support for conditional expressions as method parameters.

Important: Applications that use the old COBOL syntax for specifying named parameters as custom-attributes will not compile with the ILCONDITIONPARAM specified. This can result in any older applications failing to compile in the current version of the product. See *ILCONDITIONPARAM* for details about how to work around this issue.

The following Compiler directives have new options:

- CHECKREFMOD - now takes an additional parameter (NOZEROLENGTH), which acts as CHECKREFMOD, but does not permit reference modifier lengths of zero.
- PROTOTYPE - now supports options that specify whether prototypes are required, and the severity of error messages issued for prototype mismatches.

Containers

[Back to Top](#)

Support has been added to enable you to work with containers from the IDE. In particular you can now create a Dockerfile for a COBOL project, and build, debug and run a COBOL project in a container, all from the IDE.

Support has been added to enable the use of tools that are compatible with the Open Container Initiative (OCI) on platforms where they are supported. This is currently available on Red Hat Enterprise Linux 8.

Database Access - HCO for DB2 LUW

[Back to Top](#)

Support for the following has been added to this release:

- Multi-row fetch (MRF) and insert (MRI) statements with or without the FOR ROWS clause
- Array update and delete statements

Notes:

- These new features are supported for DB2 LUW version 11.1 Mod 4 Fix Pack or newer. Currently, IBM does not support either of these features with DB2 LUW 11.5.
- For coding examples, see the IBM DB2 LUW documentation: [Embedded SQL/COBOL Support for MRI and MRF](#).

Database Access - XA Switch Modules

[Back to Top](#)

Support for the following has been added to this release:

- XA switch modules have been enhanced to enable storage of sensitive information in the Micro Focus Vault Facility. This new functionality includes a customizable program, ESXAEXTCFG.CBL, you can use to obfuscate xa-open strings by storing them as secrets.

Data File Tools

[Back to Top](#)

The following enhancements have been made to the Data File Editor:

- Double-byte character sets are now supported within the editor.
- Insert mode is now available when editing a formatted record, except for numeric fields.
- When editing DBCS data in EBCDIC files, the required Shift-out and Shift-in characters are automatically added when editing a formatted record and you are editing in Insert mode.
- You can now load and unload structure files for an open data file.
- A ruler at the top of the editing pane can be toggled on/off.

Debugging

[Back to Top](#)

The following enhancements are available:

- Breakpoints - in JVM COBOL, you can now access a breakpoint's properties from the breakpoint's context menu in the editor.
- Expressions - you can now specify complex expressions in the **Expressions** view. The supported expressions are: normal numeric arithmetic expression with intrinsic functions and the single use of alphanumeric intrinsic functions. See *Views in the Debug Perspective* for details.

Deploying Applications

[Back to Top](#)

This release supports easier deployment of native COBOL applications from an Eclipse project. A new page in the project's properties, **Micro Focus > Build Configuration > Deploy**, enables you to specify a deploy folder and which files will be deployed. Building the project deploys certain executables and supporting files to this folder. In addition, you can archive and deploy the files on application servers, cloud storage such as AWS buckets and access the application files with AWS services, and so on.

Eclipse Integration

[Back to Top](#)

The following enhancements are available:

- COBOL compile settings summary - this pane, which is displayed when viewing the COBOL project settings at the project, folder, and file level, now indicates the settings that are inherited and the ones that are set at that level. Settings inherited from the level(s) above are shown in <>.
- Deploy folder - a new build configuration feature in the project's properties enables you to copy build artifacts and supporting files essential for deployment, to a particular folder.
- Context menu improvements - the editor context menu has been reorganized, where certain options have been grouped together under a logical heading, and other redundant options removed.
- Copybook tooltips - hovering COPY statements in the editor now displays the path to the referenced copybook.
- Collapsible statements - it is now possible to collapse IF, EVALUATE, and PERFORM statements in the editor.

- Dark theme with COBOL - you can enable the dark theme from **Window > Preferences > General > Appearance > Theme**.

Enterprise Server

[Back to Top](#)

The following enhancements are available:

- **Definition Import/Export Tool** - a new utility, `casesxml`, has been added to enable you to import and export enterprise server definitions. Using `casesxml` you can do the following:
 - generate `.xml` files, in `casesxml` export format, that contain structured definitions of a region, a CICS resource definition file, and the catalog
 - import a `casesxml` export format `.xml` file to update the definitions of a region, a CICS resource definition file, and the catalog
- **IPv6 support (EAP)** - This feature is in Early Adopter Program (EAP) release status. Some Enterprise Server components and features now support Internet Protocol version 6 (IPv6) network addressing and connectivity. Due to limitations with IPv4, IPv6 is becoming more common within corporate networks and on the public Internet. In some cases, the use of IPv6 can improve interoperability and simplify network configuration.
- **Administrative Commands** - the `add` command in `cascertreg` now contains new options (`-cwi` setting, `-dcas` setting, `-issuer`, and `-subject`).

Enterprise Server Security

[Back to Top](#)

This release provides the following enhancements:

- **Micro Focus Secrets file storage permissions**

The Micro Focus Secrets feature (also known as the Vault feature) provides centralized storage for sensitive information such as passwords, with some protection against accidental disclosure or discovery by unauthorized users. Prior to this release, the only supported storage mechanism was a conventional file containing encrypted data. In this release, the permissions on the storage file and on the Secrets configuration file are set more restrictively to help protect the secrets.

- **Certificate wildcard support**

The X.509 digital certificates used to identify servers when making TLS (SSL) connections permit the use of fully-qualified domain names with wildcards for some parts of the name. This enables administrators to use a single certificate issued to, for example, `*.mycorp.com` for any number of servers with fully-qualified names like `www.mycorp.com`, `server1.mycorp.com`, and so on. These wildcard-bearing certificates are now supported by client programs using Micro Focus communication technology when validating a server's certificate.

- **Improved ACL wildcard support**

In the Access Control Lists used for resource access control with LDAP-based security in Enterprise Server, the `".**"` wildcard sequence now behaves more similarly to mainframe RACF. A number of additional options for wildcard processing are also available.

- **PAM ESM module**

On Linux platforms, Enterprise Server now includes an External Security Manager module which integrates with the Pluggable Authentication Modules (PAM) operating system feature. The PAM ESM module can be used to authenticate Enterprise Server users with the same mechanism used for Linux users, or with any other mechanism available through PAM.

- **PKIX compliance for TLS certificate validation**

The standard for using X.509 digital certificates to authenticate servers when making TLS (SSL) connections is known as PKIX, for Public Key Infrastructure (X.509). It is defined by a series of IETF RFC documents, currently RFC 5280 and others. In previous releases, the certificate validation performed by this product did not conform to PKIX in a number of ways, most notably in using DNS address-to-name resolution in an attempt to match a certificate to a host. With this release, clients using Micro Focus Common Client technology, such as COBOL web service proxy programs, CAS utility programs, and customer applications that use the CICS Web Services Interface feature, will by default, use stricter procedures for validating certificates which more closely conform to PKIX. This improves TLS security and interoperability.

- **Security improvements for XML parsing**

In this release the third-party components used for parsing XML data have been updated, or have had bug fixes integrated into the version used by Micro Focus, to address published security vulnerabilities. Also, XML external-entity support has been disabled except where it is required by a particular product feature; this prevents XML External Entity (XXE) attacks on customer systems by attackers who can trick a customer application into parsing a malicious XML document.

Enterprise Server Common Web Administration (ESCWA)

[Back to Top](#)

This release offers the following new features and improvements:

- **MFDS User Interface functionality replacement** - ESCWA can now communicate with remote MFDS instances, and displays the equivalent pages of MFDS. Configuring regions, and their IMS, PL/I, MQ, and XA options, and security, is now available.
- **ESMAC User Interface functionality replacement** - ESCWA can communicate with remote ESMAC instances, and can replicate functionality and display all the information provided by ESMAC.
- **Configurable User Interface access** - you can now configure the ESCWA security manager to control user and group access to certain aspects of the user interface, such as, native, and security menu items.
- **Usability improvements**
 - Starting and stopping regions from the navigation tree.
 - The native menu items are not displayed if the region features are not configured correctly.
 - Configuration of the display colors for MFDS hosts and regions to distinguish them with ease.
- **CICS resource support** - the following resources are supported: ICEs, DocTemp, TCPIPService, URIMap, Bundle, Pipeline, and WebServices.
- **Scale-Out support** - ESCWA has improved the way it displays a Scale-Out Repositories (SORs) association with its PAC and member regions.
- **Redis support** - Redis is supported as a SOR when running this product in a PAC. Features include:
 - Redis cluster support
 - A Mfredis configuration file - enables you to configure reconnection when any network errors occurs. You can also use the file to configure Lua scripts tracing on servers.
 - Authentication support for the standalone Redis server.
- **Kubernetes support** - when ESCWA is run in a Kubernetes cluster, it is now possible to configure it to automatically discover the pods hosting MFDS within the cluster, and display them in the ESCWA user interface.

File Handling

[Back to Top](#)

Fileshare password files can now be stored in the Vault Facility, ensuring that sensitive user credentials are encrypted. Firstly, create the password file in the usual way, and then upload it, with a path of `microfocus/fh`, using the `mfsecretsadmin` utility.

To ensure the Fileshare server uses the file stored in the vault, start the server with the `/uv` option.

IMS Support

[Back to Top](#)

Improvements are available in the following areas:

- **BMP inbound and outbound message processing** - full support is available for BMP inbound and outbound message processing. Batch message processing programs (BMPs) can now access the IMS message queue for input and output, in addition to their batch-type processing and data-access capabilities.
- **Commands** - the following commands are now supported: `/START TRAN ALL`, `/DISPLAY Q TRAN`, and `/DISPLAY STATUS TRAN`.
- **DB Control SUSPEND / RESUME commands in an active system** - IMS DB Control supports the SUSPEND command while transactions are active. DB Control will block any new units of work and allow active UOWs to complete during a quiesce. Once DB Control reaches a state with no outstanding UOWs it suspends. Note a long running BMP may prevent a system from suspending.

This enables support for administrative tasks such as database and transaction log archiving. It also enables the creation of new transaction logs when roll forward recovery is enabled.

- **IMS BTS trace** - IMS BTS trace is now visible from active SSTM and batch jobs. WIDTH and NOHEX options have been added for additional control of trace output format.

This enables BTS output to be viewed when debugging a batch IMS application. Previously the job step had to complete before the trace was visible. This also enables you to view the trace output in an active SSTM job. Previously the MPR had to be stopped to make trace output visible.

- **User DB handler exit** - database exit support has been added for GSAM databases. This provides programmatic control of the DB Catalog setting for a database instead of using the defined DB Catalog. Also, this exit can process DL/I calls completely, for example, to map DL/I calls into VSAM I/O requests. Previously, this exit was available only for full function databases.

To assist you with writing an exit, a template file, `USERDB.CBL`, and an explanatory text file, `USERDB.TXT`, are available with your IMS classic samples.

Interface Mapping Toolkit

[Back to Top](#)

Improvements are available in the following areas:

- **Resource-based REST APIs** - the following enhancements enable the creation of resource-based REST APIs:
 - Operations in JSON RESTful Web services can now have a customizable URI path that identifies a resource. Operation paths have support for dynamic templating.
 - API resources can now be automatically identified from COBOL groups in a COBOL program, and a set of operations can be generated for each API resource.
 - It is now possible to specify the location of interface fields in the service request or response. An interface field can either be a parameter in the URI path, a query parameter, or be in the JSON message body.
- **Summary support for OpenAPI** - the IMTK now supports the OpenAPI Specification (originally called Swagger) which is the most widely-accepted format for REST API specifications. Features include:

- Consumption of OpenAPI 3.0 and Swagger 2.0 files for purposes of client and service generation.
- Generation of OpenAPI 3.0 files to describe the APIs of a JSON RESTful Web service.
- **REST service output filtering and field selection** - Enterprise Server JSON RESTful Web services now include the following features:
 - Automatic filtering of the JSON response body of a Web service by path and query parameters received in the request URI.
 - A special query parameter "\$fields" that can be used to indicate that the JSON response body is to contain only certain specified fields, and to exclude all other fields.
- **REST API discovery** - Enterprise Server API discovery is now supported. For a JSON RESTful Web service, a list of all its available operations, and their URI paths, can be retrieved. This enables a client to efficiently navigate an Enterprise Server REST Web service without having information about the service's operations ahead of time.

JCL Support

[Back to Top](#)

The following features have been added to the JCL support:

- The sample printer exit in the product has been enhanced to retrieve extended information. The structure defined by `idadoutp.cpy` now contains two new entries `(ws)-extended-output` and `(ws)-extended-data`. The item `(ws)-extended-output` contains the version of the extended output data; currently, this should be set to 1. The item `(ws)-extended-data` is a pointer, that if null means there is no extended data; otherwise, it points to a new structure defined in `outpext.cpy`. That structure contains the extended output information for a given job. This is demonstrated in the provided sample - `sampprnx`.

Library Routines

[Back to Top](#)

The following library routines are new:

- **MFU_GET_FILE** and **MFUGETF** - both these routines are used with data-driven tests in the Micro Focus Unit Testing Framework. If the `.csv` file under test references external data in one of its cells (using the `@file-name` notation), use either of these routines to load that external file into memory before such tests are run.

The following library routine contains new functionality:

- **CBL_GET_EXIT_INFO** - this library routine has been enhanced to better detect the circumstances in which an exit procedure has been invoked.

The Micro Focus Database File Handler

[Back to Top](#)

Support for Db2 and Microsoft Azure databases has been added to the Micro Focus Database File Handler (MFDBFH). This support is equivalent to that of the existing databases.

The following features have been added for all databases:

- I-O optimizations for sequential, line sequential, and ESDS/KSDS/RRDS files opened for output.
- Using direct connection strings to make a database connection (as an alternative to using ODBC DSNs).

- Creation of databases using script files.
- Maintaining database configuration files with a command line utility, `dbfhconfig`.
- Using the `dbfhdeploy` utility to delete data files from a datastore.
- Database configuration files can now store confidential information in the Vault Facility.
- CTF tracing of ODBC and Vault operations.
- Recovering of locked processes or files can with the `dbfhadmin` utility.
- The `dbfhconfig` and `dbfhdeploy` utilities are now capable of executing commands batched up in a response file.

The Micro Focus Unit Testing Framework

[Back to Top](#)

The following enhancements have been made to the Micro Focus Unit Testing Framework:

- You can now run unit tests against an executable file from both the IDE (new in Eclipse) and the command line. Before you run such tests from the command line, you must initially rebuild the executable in order to link it into the testing framework.
- The `.csv` source files used in data-driven tests can now reference external data: use the `@file-name` notation in a cell to use the contents of `file-name` in the tests. The external source files must be loaded into memory, using the `MFU_GET_FILE` or `MFUGETF` library routines, before the tests are run.
- Two new elements are available for data-driven tests: a data-driven setup and a data-driven teardown. Conventional setup and teardown entry points would run multiple times during a data-driven test; these two entry points run only once per test run.

The Microsoft Build Tools and Windows SDK Configuration Utility

[Back to Top](#)

On Windows, the Enterprise Developer setup file now installs the Microsoft Build Tools and the Windows SDK packages, as these are dependencies for a number of features and operations of the product.

You can use the Microsoft Build Tools and Windows SDK configuration utility to view the package versions in use in your COBOL environment. You can also use this utility to set the environment to use other versions of these packages that you have installed.

Multi-Threaded Applications

[Back to Top](#)

This release includes the following improvements:

- Improved validation of detached threads on UNIX - the reliability for applications with many threads, when using the `CBL_THREAD_KILL` routine and during abnormal process termination, such as when an error occurs, has been improved.
- Thread local storage optimizations - the thread termination in applications with many threads has been optimized.

PL/I Support

[Back to Top](#)

Enhancements are available in the following areas:

PL/I compiler

Improvements in the compiler make it easier to migrate existing applications to new platforms. Support is available for:

- The GENERIC attribute on an ENTRY declaration.
- The COPY option of the GET statement.
- Assignment of an ENTRY to an ENTRY LIMITED variable.
- The INONLY attribute.
- Support for a SELECT with no WHEN or OTHERWISE modified to match IBM's behavior.
- Support for new compile option which allows specification of the FIXED DECIMAL precision for intermediate operations.
- The ability to use LIKE on a structure that contains * for element names.
- Built-in functions:
 - New functions - FIXEDDEC and FIXEDBIN
 - The TRIM built-in function to support its usage with structures.
 - The VALID function - improved support when used with FIXED DEC arguments.
 - Function precision of 15 or 31 (see the `-bifprec` compiler option)
- PL/I bytestream IO via FILEREAD, FILEWRITE, FILETELL and FILESEEK statements.
- Improved compatibility - when using DEFAULT RANGE with patterns; for use of the STRING pseudovvariable.
- Improved support for - structures declared with the LIKE attribute where the referenced structure members contained NOINIT attribute(s).

Improved functionality for customers using Open PL/I to develop z/OS applications is available:

- Improved compiler listing to show attributes of parameters to an ENTRY declaration.
- Improved expanded listing showing line numbers for code generated by preprocessors.
- Improved compiler diagnostics when trying to use BIT operators on non-BIT operands.
- Improved compiler diagnostics when an unqualified name is resolved to a structure member rather than a matching non-member declaration of the same name in a parent block - Informational (I-level) diagnostic (MFPLI01305I).
- A string indicating which compiler was used to generate the object code is now embedded in every compiled routine to facilitate ease of upgrading and troubleshooting by customers.
- *PROCESS statements are now mapped to the equivalent Open PL/I compiler options where appropriate.

PL/I debugger in Eclipse

Support is available for the following features:

- STEP out of the end of an ON Unit.

When stepping off the end of a PL/I ON-unit, the debugger determines which the next debuggable statement is. This enables the setting of a temporary breakpoint so you can continue stepping through the program upon return. Stepping through a PL/I GOTO statement from an ON-unit is supported as well.

- Improved monitoring of variables that is not based on the procedure in which they are declared.
- Support for debugging PL/I application using Solaris (SPARC) 11.4 or later.
- PLIDUMP now generates information for STATIC variables and displays the HEAP data storage.
- Changes have been made to remove the variable scoping limitation which existed in previous releases. Prior to this version, variable watches were limited to the procedure in which they were declared/used. If a variable was passed to another subroutine, the debugger would only stop after returning from that subroutine and recognizing that the variable value had been changed - so it wasn't possible to know

exactly where in the subroutine it had happened unless an additional variable watch was set in the subroutine itself.

In this release, the variable's address and size are now being stored away for watch instead of the procedure name and variable name. This allows the address/size to be monitored from the time it is established until you cancel the watch. By doing this, the debugger is stopped as soon as it recognizes a change of value - regardless of where it is in the user program.

Since the watch is active until you cancel it, it is possible to be watching an address/size which is no longer allocated or active depending on the flow of the user program. In this situation, execution will be stopped if/when the memory space is reused for some other reason.

PL/I EXEC preprocessor

- Information about host variable references and modifications is now available for the background parsing.
- %SDEBUG and %RDEBUG statements now indicate the line and column where the macro invocation starts or ends.

Macro preprocessor

- Supports the new SOURCEFILE() built-in function
- Improved compatibility for %DO statements
- %SDEBUG and %RDEBUG statements now indicate the line and column where the macro invocation starts or ends

Run-Time System

- Support is available for bytestream IO via FILETELL, FILESEEK, FILEREAD and FILEWRITE for RECFM(U) files.
- Support for the COPY option of the GET statement.
- It is now possible to use a STATIC FIXED BIN(31) variable to control the RECSIZE of a file at OPEN time.
- The JCL utility IKJEFT01 can now be driven from PL/I as a callable interface.

New Platform Support

[Back to Top](#)

Support is now available for Enterprise Developer Unix Components for the following additional platforms to the same level that other UNIX platforms (different than Linux) are supported:

- Ubuntu Linux 18.04.x (LTS) on 64-bit Intel (x86-family)
- CentOS v7 and v8 on Intel x86-64

For a full list of the supported operating systems, check the *Product Availability* section on the Micro Focus SupportLine Web site: <http://supportline.microfocus.com/prodavail.aspx>.

Problem Determination

[Back to Top](#)

The following enhancement is available:

- **Consolidated Tracing Facility (CTF) on UNIX** - CTF is now always present during process termination, such as when an application, or a third-party code, calls exit() directly.

Product Documentation

[Back to Top](#)

The following functionality is new in this release:

- Online context help in Eclipse - online context Help is now the default setting for Enterprise Developer. Requesting F1 help from within Eclipse now opens the documentation available on Micro Focus SupportLine. You can configure Eclipse to show either local or online help. See *Viewing the Product Help* in the *After Installing* section.

Significant Changes in Behavior or Usage

This section describes significant changes in behavior or usage. These changes could potentially affect the behavior of existing applications or impact the way the tools are used.

The numbers that follow each issue are the Support Incident Numbers followed by the Reported Problem Incident (RPI) number (in parentheses).

Adis

[Back to the list](#)

- In RM/COBOL, the ACCEPT of a screen with an input field beyond the end of the screen would operate as if the field was at the last character of the screen. Previously, ADIS would ignore any fields past the end of the screen. Now, with Dialect"RM" set and the appropriate ADISCTRL settings, behavior will now match RM/COBOL in this case.

3138718 (1112690)

Application Workflow Manager

[Back to the list](#)

- REST Connection function package attribute has been added, and Status Handlers for REST tools. See "REST Function Package" in your product Help for more information.
- If the Search button is used in the Endeavor attachment application, duplicate values are no longer displayed in the resulting list.

3201329 (1117831)

AppMaster Builder

[Back to the list](#)

- Data View preferences have been enhanced to provide a setting that limits Data View generation searches to a single SQLDDL member instead of searching for all SQLDDL members identified by the full SQLDDL path saved in the SQLSCHEMA file. When searching for an SQLDDL member, the generation process searches the primary project path first, followed by SQLDDL workgroup paths.

3216343 (1119348)

- In the SQL Schema Maintenance dialog box, the SQLDDL members were not always sorted alphabetically. This has been corrected. In addition, the SQL Schema Maintenance dialog box has been updated with "LOAD" and "Filter" buttons that enable filtering.

3215756 (1119133)

Assembler Support

[Back to the list](#)

- A problem with the MFASM command-line processor program caused RC=4 warnings that prevented the linker from being invoked. To correct this, the MFASM.EXE and MF370CHK.DLL modules have been updated to produce .390 executable modules even when warnings occur during assembly.

3224507 (1119933)

- A problem that caused the &SYSNEST macro processor to be incompatible with mainframe assembler has been fixed by reducing the system value by 1.
- A problem that caused National Language Characters in assembler listings to be echoed to the console during assembly and appear as box drawing characters has been fixed.
- MNOTE errors are no longer treated as fatal errors. If only MNOTE errors are reported at assembly time, the Assembler .obj file will be produced and the linker will be invoked.

3204758 (1118136)

- Invalid parameters specified in the Additional Directives text box are no longer treated as fatal errors by the Assembler command-line processor. Previously, invalid parameters would prevent the Assembler linker from being invoked even if the assembly was successful.

3204319 (1118090)

Call prototyping in library routines

[Back to the list](#)

The copybooks `cbltypes.cpy` and `cblproto.cpy`, provided by this system for call prototyping in library routines, include features of the latest syntax, specifically the `CONSTANT` keyword. If these files are used in conjunction with the `MF` directive, it should be set to the current level, 21; otherwise, you should remove the directive, or do not use these copybooks.

Common Communications Interface

[Back to the list](#)

- The default TLS Security Level has been increased from 0 to 1. This change will not affect any user that has specified their own security options. Users relying upon the default TLS security options might find that some old clients that are restricted to the use of weak ciphers will no longer be able to connect.

See "Security Levels" and "Specifying a Server Protocol and Cipher Suite Preference" in your product Help for more information on the change to Security Level 1.

Communications Server

[Back to the list](#)

- The optional Digital Certificate Authentication Service (DCAS) feature of Enterprise Server, most commonly used to provide single-sign-on for TN3270 clients, has been updated to address a severe security issue. Customers using DCAS should refer to the topic "DCAS security" in the product documentation. To determine whether your enterprise server regions use DCAS, look for listeners with the "dcas" conversation type. DCAS listeners now require client certificate authentication by default. If you are using DCAS with an external DCAS client such as Host Access for Cloud (formerly Host Access MSS), and that client does not supply a certificate, you need to add the following setting to your DCAS listener configuration: [Operation] allow unauthenticated clients=yes

Compiler

[Back to the list](#)

- "file not found" error messages now provide more information about the key the user needs to press. The new format of the messages is as follows: "File name.cpy not found - Press [S]top/[R]etry/[C]ontinue/[A]lter-path".

Data Tools

[Back to the list](#)

- You are no longer able to modify data in a structured record that is identified as comp-2 floating point - an alert is displayed if attempted. This is in order to prevent the data becoming corrupted.
3213037 (1118867)
- Data File Tools now utilizes the configurable codesets facility to use a variety of character sets - see 'Working with Different Character Sets' in the documentation for more information.
3161243 (1114482)

Database Access - OpenESQL

[Back to the list](#)

Just like other DBMS SQL COBOL precompilers, OpenESQL now follows embedded SQL standards and disallows the use of group host variables in WHERE <column> = :hostvar clauses. In the past, this was not flagged at compile-time, and would lead to unpredictable results when executed.

Documentation

[Back to the list](#)

- The information about the -flag and warn compiler options has been updated.
3190928 (1120000)

Early warning of compatibility issues with current operating systems

[Back to the list](#)

In order to better support modern operating systems, we are aligning closely with their operability guidelines. We now detect previously-undefined behavior when interacting with OS level functions.

Error RTS096 alerts you to any calls to the operating system's fork() API, in a process that has directly or indirectly called COBOL functionality, in your code.

The error gives you an early diagnosis of a situation which, if left unchecked on modern operating systems, could lead to deadlocks, crashes or other failures at run time. These problems would often occur intermittently and be very challenging to track down.

See the KB article <https://community.microfocus.com/t5/Visual-COBOL-Knowledge-Base/fork-rts64-Error-96-encountered-in-child-process/ta-p/1771191> for more details.

Enterprise Server

[Back to the list](#)

- IF an XA open string uses the BATCHONLY option, CRCN will not monitor the XA connection to the resource manager. If the BATCH SEP encounters a severe XA error, the batch SEP will be recycled until the connection is recovered. This emulates the previous version of the XA reconnect feature when ES_XA_????_NB_RETRIES=-1 was set. Consequently, if an open string contains BATCHONLY, only a batch SEP will be able to access the resource manager and, as CRCN is a CICS transaction, it will not monitor this entry.

3213379 (1118913)

- The initPac option for the caspac command line utility has a change in behavior. Prior to PU5, if the command detected that there were active regions in the PAC, the command would return an error and not initialize the PAC. This only occurred when: 1. There are active regions in the PAC. 2. There are no active regions in the PAC, but a region has shutdown without notifying the PAC SOR (PSOR), for example, if the region was killed. In this case, it was not possible to cold start a PAC without manually correcting the appropriate value in the PSOR. The initPac option will now prompt for confirmation on whether you really wants to initialize the PAC, giving you the option to cancel. CAUTION: Only use this option for scenario 2, ensuring that no cas* or mfcs processes remain for regions within the PAC. If it is used when there are active regions in the PAC, the regions will no longer function correctly.

(642125)

- Enterprise Server now supports Redis Cluster as a SOR. See "Prerequisites" in the "Scale-Out Performance and Availability Clusters" chapter in your product Help for more information.
- When compiled with the XAID Compiler directive, JCL batch SQL applications now work correctly when MFDBFH is enabled.

3223257 (1119804)

- Deferred work elements for cancel will not be processed until the End of Task. This means that the cancel will not be processed during a user syncpoint.

3193871 (1117144)

- A problem where a failed syncpoint did not result in a failed transaction, leading to incorrect commit states, has been fixed by changes in syncpoint processing. A syncpoint involving XA resource managers can fail in one of three ways: 1 - During phase 1 - xa-prepare. When one of the RMs enrolled in a LUW returns an error on the prepare, the LUW is rolled back. An application can now intercept the EIBRESP and EIBRESP2 using the NOHANDLE option: EIBRESP = 78-EIBRESP-is-ROLLEDBACK - 82 EIBRESP2 = 78-EIBRESP2-sync-prepare - value 124 Otherwise the transaction abends with abend code AEXJ - ROLLEDBACK. 2 - During phase 2 - xa-commit or xa-rollback. When one of the RMs enrolled in a LUW returns an error on the commit, the LUW is left as is, and a severe error is sent to the console. The application cannot handle this failure. (This is mainframe-compatible behavior.) 3 - A syncpoint can also fail during the systematic xa-start called after the completion of the syncpoint commit phase 2. Behavior in this case is unchanged; the transaction will abend with system code AEIJ - NOSTART. This failure cannot be handled by the application.

3193283 (1117153)

- For regions that are not TRANCLASS-enabled, the EXPIRYINTMIN attribute of the TSMODEL resource is now supported. In addition, the LASTUSEDINT option is now supported on the INQUIRE TSQNAME and INQUIRE TSQUEUE commands. Note that this changes the queue control record and will affect any existing queues that were created with earlier versions of the product (affects non-TRANCLASS

regions only). As a result of this, you need to cold start the Temporary Storage and Transient Data after applying this Patch Update. You also need to cold start any PACs that have existing TS\TD queues.

Enterprise Server Common Web Administration

[Back to the list](#)

- By default, ESCWA now runs on port 10086.
- When using the Vault Facility, the ESM passwords are now accessed by the ESM's Universal Unique Identifier (UUID) which makes the key for the vault. If this UUID cannot be found it uses the old name based mechanism as the key for the vault. Note: All new ESMs have a UUID that conforms to 4122 RFC. The earlier ESM UID standard is still supported.
- PAC names are now limited to eight characters or fewer in ESCWA.
- The default ESCWA configuration file now sets ESCWA to run in loopback-only mode.

Enterprise Server Security

[Back to the list](#)

- The MLDAP ESM Module for Enterprise Server now interprets the ".**" wildcard sequence in a manner closer to that of mainframe RACF. This behavior is configurable. See "Wildcards for Resource, User, and Group Names" and "MLDAP ESM Module Custom Configuration Information" in your product Help for more information.

3206992 (1118359)

File Handling

[Back to the list](#)

- The supervisor password is no longer displayed when cobfsclose is executed from the command line.

3195772 (1117571)

- Usernames in the Fileshare password file are no longer obfuscated; they are shown in plain text.

3120656 (641976)

- Fileshare can now read a password file stored in the Vault Facility. Use the /uv option when starting Fileshare to read the specified password file from the vault. Note: You must have uploaded the password file to the vault before starting Fileshare.

- The SFF (Signed Free Form numeric) input field is now supported in the TRAILER3 operand.

3217597 (1119504)

- The calculated output length of SORT and the memory required could be calculated incorrectly when symbols were used.

3203471 (1118031)

- File and folder names that are deployed to PostgreSQL datastores are now case-insensitive. This ensures consistency of behavior with DB2 and SQL Server datastores.

HCO for DB2 LUW

[Back to the list](#)

- There is no longer a problem using an XML CLOB host variable in COBOL and PL/I program SQL statements when compiling with the DB2 ECM Compiler directive.

3204413 (1118115)

IDE

[Back to the list](#)

- A bug that prevented adding multiple Program Breakpoints has been fixed.
3222576 (1119722)
- Environment variables with the format `${env.<name>}` are now handled correctly during compilation and background parse.
3215414 (1119077)
- A new option has been added to the Window> Preferences> Micro Focus> Debug dialog box: Ignore breakpoints in resources within unrelated projects. When selected, this option guards against the situation where you have identically-named programs within your workspace, and setting a breakpoint in one could cause the other programs to break when they are debugged (if the corresponding lines are debuggable). To continue current behavior, this option is not selected by default.
3211196 (1118694)
- Populated folders can now be used as output folders for JVM COBOL projects.
3210830 (1118646)
- A new option has been added to allow you to edit the location of a remote linked folder. It opens the same wizard as when creating a new remote linked folder, but in edit mode.
3200758 (1117951)
- It is now possible to access a breakpoint's properties from the breakpoint's context menu in JVM COBOL code.

Interface Mapping Toolkit

[Back to the list](#)

- The COPYEXT directive on remote projects now works correctly.
3206621 (1118324)

JCL Support

[Back to the list](#)

- The wrong Symbol value was used when a symbol was assigned a different value following a procedure.
3223719 (1119901)
- When replacing symbols in in-stream data, space-separated elements will be taken into account, and if possible, the original position will be maintained.
3222942 (1119802)
- An issue where procedure COND statements were applied to the wrong procedure steps when the procedure was called multiple times, notably the steps from the first call to the procedure when they should be applied to steps from the specific call, has been resolved.
3222081 (1119699)
- The JCL JOB JOBRC parameter is now honored, and the correct return code set for the job.
3218927 (1119420)
- The MFFTP LCD, MGET and MPUT commands have been enhanced to process the members of a partitioned data set.
3216865 (1119242)
- The removal of datasets with DISP=NEW because MF_UCC11=YA or MF_UCC11=M is set has been restricted so that the DSORG, if defined on the DD Card, must match the catalog attribute. The removal of a GDG Base by this method is prohibited. If the dataset cannot be removed and recreated, an error message JCLCM0200S is issued.
3216471 (1119195)

- You now receive a correct error code, if an error occurs while processing the TSO RENAME command.
3215386 (1119281)
- The JCL File Action exit, MFJFAXIT, is now notified of the deletion of cataloged data sets.
3212961 (1118856)
- A problem in the public catalog API, mvscatpb, where the LRECL values for variable length files were not validated correctly, producing false errors, has been corrected. The API will now return the catalog record that has been changed.
3212769 (1118940)
- The incorrect changing of a VSAM data set file status from pristine to used when REPROing an empty data set has been corrected. When REPROing records into a data set, if the source data set is empty, the destination data set is not opened.
3212733 (1118839)
- GDG restart information is usually created only when ES_JES_RESTART=Y and MF_UCC11=Y or M; however, by setting environment variables GDG_RESTART_UCC11_ONLY=N and ES_JES_RESTART=Y results in the restart information for GDGs to be created. This ensures that the dynamic setting of MF_UCC11, via the MFJUXIT user exit, can be applied to GDG versions. The MFJUXIT user exit has been enhanced to provide a new event call, event-job-restart, which is called when a job is restarted, and provides the option for the user exit to be notified of future event calls - one of which is 'event-job-ready', where the user exit can set the MF_UCC11 value for the job (see mfjdxit.cpy for user exit information).
3207134 (1118753)
- If a JOB CARD includes a USER ID and a PASSWORD that are different from the ones for the user submitting the job, the credentials specified in the JOB CARD will be used to validate the permissions to submit a job in place of the surrogate user.
3207055 (1118326)
- LISTDS now returns 8 if the requested dataset does not exist. Previously, it would return zero.
3204627 (1118102)
- PDS directories (PO) identified by environment values (the path to the directory starts with \$<ENV-NAME>), are now removed in the same way as those that do not use an environment value. The last member is removed and the directory is empty.
3196118 (1117345)
- The MFJPTPCH module now supports the PREFORM and CNTRL parameters.
3194158 (1117171)
- Using MFFTP, a GET request that used SENDEOL no longer attempts EOL processing if the file is not found. This now emulates the behavior on the mainframe. Previously, processing would cause unexpected errors in cases where the file was not found.
3192989 (1117084)
- If the catalog properties of a data set are updated using MVSCATPB, and the data set is not opened during the JCL step it is assigned to, then the updated catalog properties are not written at the end of step disposition processing.
3186942 (1116611)
- It is now possible to export symbols from Enterprise Server and to use them in in-stream data. You can also pass symbols on jobs submitted using the Internal Reader.
3164066 (1114816)
- When trying to export entries from a catalog that does not exist, mfcaxml will now report an error and exit with a value of 12. Previously, it returned zero and created the catalog.
- An issue with error conditions incorrectly carried forward from one VSE job to the next one has been resolved.

3220394 (1119913)

- The length of a SYSIN is no longer being checked unnecessarily.

3201488 (1117900)

Micro Focus Batch Scheduler Integration

[Back to the list](#)

- When running against an Enterprise Server PAC environment, mfbsijcl could return an invalid return code to the scheduler. This has been resolved. Note that both of the following environment variables must be present in the mfbsi.cfg configuration file in order for mfbsijcl to work with the Enterprise Server PAC environment: ES_PAC and ES_PAC_ENDPOINT.

3215408 (1119254)

Micro Focus Directory Server

[Back to the list](#)

- UNC paths are no longer supported when importing or exporting to MFDS by default. To re-enable them, set the environment variable MFDS_ALLOW_UNC to 'Y'.

National data items in JVM COBOL code

[Back to the list](#)

JVM COBOL code that uses IS NUMERIC tests on NATIONAL or NATIONAL NUMERIC data items, or uses NATIONAL NUMERIC data items in programs compiled with the CHECKNUM Compiler directive must be recompiled in this release. Compiled code from earlier products that uses such constructs will generate a `MissingMethodException` error when run under this release.

PL/I Support

[Back to the list](#)

- A problem with allocation of BASED, CONTROLLED, and AUTOMATIC structures has been corrected. This problem was limited to structures where the last member field was of type BIT. Specifically, the problem only occurred for BASED, CONTROLLED, and AUTOMATIC structures when the last member field is of type BIT, resulting in incorrect code generation for BASED and CONTROLLED storage at the point of allocation (i.e., an ALLOCATE statement), and for AUTOMATIC storage, incorrect stack frame allocation for the declared structure. Naturally, any module affected by this problem needs to be recompiled. To ensure that no problems arise, the user should identify all modules that use a structure or structures where the last member is of type BIT, and recompile those modules. This applies to users who have compiled code with versions of Enterprise Developer earlier than ED 4.0 HF 10. Note: BIT means a bit-string of any length, including BIT(1). It does not apply to BIT ALIGNED.

3192381 (1117048)

- The macro preprocessor loop no longer occurs when there is a "DO" statement with "BY" and without "TO". For example, statements such as "DO J=1 BY 1" are treated as infinite loops.

3216391 (1119216)

Rebuild required for projects unable to locate the Windows Resource Compiler

[Back to the list](#)

Projects that were last built in a version prior to 6.0, and that rely on the Windows Resource Compiler (`RC.exe`) need to be rebuilt in Eclipse, otherwise they may produce an error. This is due to the relocation of `RC.exe` in this version of the product. Affected projects will be those that explicitly reference a manifest file (used to include such things as cursors, fonts, and icons), and that are built directly from the command line.

The problem is fixed if you open and build the project within the Eclipse IDE (as `.cobolBuild` is rebuilt to find the new location of `RC.exe`). Alternatively, you should ensure that `PATH` contains a reference to `RC.exe` if you continue to run projects from the command line.

Run-Time System

[Back to the list](#)

- Previously, the value of the fill character and the option to use it were ignored in the RM window control block. With this fix, the character will be used if `Dialect"RM"` is set and an appropriate `ADISCTRL` configuration is used.

3138692 (1112552)

SQL Option for DB2

[Back to the list](#)

- The XDB Service name has been shortened.

3195822 (1119897)

VALUE clause not permitted to follow items that use the OCCURS DEPENDING ON clause when ODOSLIDE in effect

[Back to the list](#)

If your Working Storage contains a data item with the `OCCURS DEPENDING ON` phrase, and `ODOSLIDE` is in effect, any subsequent data items at the same or higher level must not contain a `VALUE` clause. If they do, an error (`COBCH1962`) is now generated.

If you cannot remove the `VALUE` clauses from your source code or remove `ODOSLIDE`, contact [SupportLine](#).

Known Issues

Refer to the *Known Issues and Restrictions* topic in the *Product Information* section of your product Help.

In addition, note the following:

- The Server Core form of Windows Server 2019 is not supported.
- Oracle does not support deployed .NET Core 3.x client applications on SUSE Enterprise Linux accessing Oracle databases.
- In Enterprise Developer 4.0 and 5.0 in an extremely small and limited set of cases, an issue could occur with running .NET executables and .dll files, or JVM .class files, created with an earlier version of the product. This issue only occurred if:
 1. The application performs an IS NUMERIC condition test on a variable declared with USAGE NATIONAL.
 2. The application has been created with Enterprise Developer 3.0 or earlier, then executed in Enterprise Developer 4.0 or 5.0.

In these rare cases, the IS NUMERIC test could provide the wrong answer.

In order to resolve this issue, in Enterprise Developer 6.0, the .NET COBOL and JVM COBOL run-times reject any program using IS NUMERIC on a NATIONAL item which was compiled with a version 5.0 or earlier of the product. You receive a "missing method" exception. To resolve the issue, you need to recompile any programs that use this construct in Enterprise Developer 6.0.

Programs that do not use NATIONAL data, or those that have been recompiled in Enterprise Developer 6.0 are not affected.

- The COBOL editor in Eclipse might show incorrect error messages for a linked resource with file-specific COBOL settings as the file settings are incorrectly ignored.
- When breakpoints have previously been set in a remote PL/I program in Eclipse and a new debugging session is started for a local PL/I program, the debugger will crash. The same issue occurs if previously set breakpoints are present on a local PL/I project and a remote debug session is started.

To work around this you need to clear all previously set breakpoints in remote (local) projects before starting a local (remote) debugger session. You can remove the breakpoints from the Breakpoints view in the Debugger perspective.

- The ChangeMan Attachment models of release 5.0 and earlier are not working in the expected manner under Enterprise Developer 6.0. This is a result of several tools that are called with a static value=`^*` in the input parameter `CMG_PROP_STATIC_SUBSYSTEM`. If you want to run a ChangeMan attachment model 5.0 and earlier under Enterprise Developer 6.0 you must remove the static value=`^*` from all `CMG_PROP_STATIC_SUBSYSTEM` input parameters.

Resolved Issues

Adis

[Back to the list](#)

- A single field is no longer padded to the right when the SIZE clause data-name is greater than the PIC clause and all the other fields have the PROTECT attribute.
3223862 (1119916)
- An ACCEPT on SECURE fields no longer produces unwanted characters.
3221450 (1119807)
- Using JUST and ZERO-FILL in a CONTROL clause with ADISCF option 16 set to 3 no longer causes an RTS 114.
3198021 (1117521)
- ACCEPT ON ESCAPE KEY and ACCEPT ON ESCAPE data-item now return the correct key-code in RM/COBOL for function keys and escape. Note that the complete list of the returned key codes are not 100% compatible with RM/COBOL for all keys.
- You no longer receive an RTS 114 error when the UNIX environment variable COLUMNS > 164 for DISPLAY AT LINE COLUMN syntax.

Application Workflow Manager

[Back to the list](#)

- You can now specify output parameters for the "Execute ISPF Edit Macro" tool. See "Execute ISPF Edit Macro" in your product Help for more information.
3206129 (1118264)
- The AWM application unload actions are now executed for the application which was loaded when the workbench was started.
3193437 (1117143)
- The Micro Focus z/Server connection now supports SSL/TLS connections without a client certificate (Root-CA only).
3186051 (1117570)
- It is now possible to model an "Execute ISPF Command" tool in AWM which creates an entry in the AWM Jobs view for a specified job ID. The tool must call the REXX procedure TAUTORJI.
3177843 (1115908)
- You can now display JES input data sets under jobs in the JES Explorer. Right-click JES Explorer > Properties. In the Subsystem page, click Show input data sets, and then click Apply and Close.
3168184 (1117102)
- The command to open a data set member from the MVS search result view checks the defined file mappings and opens the source in the corresponding editor.
3143591 (1112987)
- It is now possible to specify job phases in the JES Explorer filters (All, Waiting, Active, Finished).
3141458 (1112963)
- Jobs in the JES explorer are now sorted so that the most recent ones are at the top of the list. Additional attributes are shown in the Remote Systems Details view.
3140342 (1112964)

- It is now possible to define named action contexts under an AWM action descriptor. This enables you to define actions that contain both single processing and mass processing - for example, selecting multiple files from a single project and copying them to a different location.

(639855)

- The AWM tool "Transfer File" will always replace existing target resources. It is now possible to configure how to handle existing resources using the "Existing Resource Handling" tool attribute.
- Previously, the AWM tool "Merge Structured Files" did not merge JSON files properly.
- The Application Workflow Manager API JavaDoc was not exported and was therefore missing. This is now fixed.
- The Selection Property Mapping under an AWM global editor action now includes an additional selection value SelectedLineNumbers. It returns the number of lines selected in the editor within an AWM property.

3185123 (1116473)

- The open/close status of the Table Results view filter box is now persisted. Once a user has opened the filter box for a Table Results view, the filter box never disappears (not even after closing the view or restarting Enterprise Developer), unless the user manually closes it.

3170064 (1115241)

- It is now possible to use white spaces in the Value_Keys and Label_Keys attributes of the AWM properties.
- The SVN function package tool "Checkout" can now be configured to check out resources as an Eclipse project in the background, without the use of a wizard.
- AWM element list structures with duplicate columns caused an issue in the "Configure Columns" dialog box.

3218437 (1119439)

- Using the "Window > Editor > Toggle Split Editor" function was causing issues with modeled AWM editor actions.

3192663 (1117175)

- After execution of Action Descriptors where the attribute "Refresh List" was set to true, only one element list would be updated even if more than one was selected. All element lists of selected elements are now refreshed.

3151145 (1113670)

- The AWM SCM attachments for ChangeMan, Endeavor and SCLM now contain CUSTOM libraries for REXX procedures and ISPF skeletons. The CUSTOM libraries should be concatenated in front of the product libraries in the MFA user server. If a delivered REXX procedure or an ISPF skeleton has to be adapted, it must be copied from the product library to the CUSTOM library, and be adapted in the CUSTOM library.
- It is now possible to define a custom code page for the USS Explorer.

3209201 (1118608)

AppMaster Builder

[Back to the list](#)

- A problem with building Data Views that generated a return code of 2 caused a severe error message to appear in the AMB Console. This has been corrected by changing the messaging for return codes lower than 5 to indicate generation with no errors.

3214321 (1119227)

- A problem that caused filtered controls to be cut off has been fixed.

3214165 (1118976)

- A problem with the AMB Editor that sometimes prevented copied code to paste properly has been fixed.
3203590 (1118030)
- When accessing the AMB Preferences dialog box, program types of "STUB" or "BATCH" were erroneously being reset to type "APSPROG". This issue has been corrected.
3201766 (1117901)
- Keywords no longer shift to the right when a space/blank character is entered at the beginning of the keyword.
3197568 (1117486)
- A problem in the AMB Editor that caused text to spill past column 73 when the REM keyword was pasted in at the beginning has been corrected. Any text beyond column 72 is now split onto a new line.
3197372 (1118005)
- A problem in the AMB editor that prevented code statements from shifting to positions of correct indentation has been fixed.
3197354 (1117466)
- A problem in the AMB editor that caused incorrect indentation of conditional statements with continuations has been corrected.
3196706 (1117464)
- The Modified flag is longer set when clicking the mouse on an empty line.
3194325 (1117222)
- A problem that caused pasted IF statements to lose indentation has been fixed.
3192103 (1117052)
- AMB Editor options have been updated to include the option to split a line by move each word to the right of the split to its own line, or to shift every word to the right of the split to a single new line.
3127667 (1111444)

Assembler Support

[Back to the list](#)

- A problem that caused Swedish national characters to display as line drawing characters has been fixed. Filenames with accented characters now display correctly.
3204665 (1118779)
- Errors produced by unsupported Assembler syntax have been corrected by an update that allows addition or subtraction of character literals to match IBM Assembler behavior. The EBCDIC value of the literal is now added or subtracted from the value of the relocatable data item. For example: TR CHARTAB(32),=C'0123456789ABCDEF'-C'0' now assembles without error, and generates mainframe-compatible object code.
3204543 (1118137)
- A BRNZ instruction generated incorrect machine opcode. The BR (branch relative) and BR..L (branch relative long) extended mnemonics were placing the condition mask nibble in the fourth nibble of the instruction instead of the third nibble resulting in incorrect behavior at execution time.
3197056 (1117444)
- A problem that produced invalid expression errors when substring notation in AIF macro statements used an asterisk (*) for length (for example: AIF ('a string'(5,*) NE 'EI').EXIT) has been fixed.
- A problem that caused an assembler program to be identified as CICS based on a user-written macro named 'EXEC' has been corrected. Programs are now identified as CICS only when 'EXEC' is followed by 'CICS'.
3182606 (1116316)

- The Assembler LE/370 prolog and epilog macros, CEEENTRY.MAC and CEETERM.MAC respectively, have been rewritten to be more mainframe compliant. While this new base-level functionality is sufficient for most LE/370 assembler application requirements, some features, such as NAB (Next Available Byte) emulation, are not included in this fix.
3221676 (1119641)
- On rare occasions, the user abend SVC 13 would generate RTS114 errors in the MF370ENG.DLL module. The module now tests for invalid addresses.
3210918 (1118676)
- The CEEENTRY macro now uses a new NAB emulation feature implemented in the MFASM run time module. NAB buffer areas and data structures now emulate the mainframe NAB LE/370 data structure.
3203475 (1118026)
- The Assembler debugger was entering "zoom" mode under the Enterprise Developer CICS environment. It now pops up and waits for user input.
3183858 (1116890)
- An issue in the MFASM generalized trace facility has been resolved so that you no longer receive an RTS 114 error when GTF is enabled.
3207628 (1118370)
- The LE/370 prolog macro CEEENTRY.MAC has been modified to support the NAB (Next Available Byte) control block. Note that fields in the control block are currently set to nulls.
3191776 (1117022)

Character Animator

[Back to the list](#)

- A Perform Step of a CALL statement in INT code, after using the Do function, and then changing the execution point with the Reset function, now steps over the CALL correctly.
3222172 (1119750)
- When detaching the debugger from a process on Solaris, the process no longer crashes.
3213587 (1118926)
- Two new command line options for Animator can be used to speed up the Animation of coredumps for applications with a large number of programs. Specifying these new options "FASTLOAD" and "FASTEXIT" on the command line will result in Animator starting and stopping significantly quicker. See the documentation for details on these new options.
3212276 (1118852)
- CBL_EXIT_PROC routines can now be debugged correctly.
3208380 (1118433)
- Querying an OCCURS ... DEPENDING ON ... where the item is zero is now treated as an invalid query and the item is not shown.
3201182 (1117795)
- When zooming and using Perform Step/Out over applications with many programs which have many COPY statements, performance is improved.
3197159 (1118692)

Code Analysis

[Back to the list](#)

- A change has been made to allow DFHEIBLK to appear as an input and output parameter to extracted components created in Logic Analyzer.

3226429 (1120119)

- If you wish to perform component generation using CICS, find the CICSslice option in the project options file (Options.Project.xml or p00000X.xml) and change VALUE="false" to VALUE="true". After the regeneration, you will get instead of a CALL statement an EXEC CICS LINK PROGRAM statement. If the CICSslice option is left in its default state (false), the generated slice will include in the generated structure BRE-INP-INPUT-STRUCTURE the DFHEIBLK members.

3226425 (1120121)

- The structure slice no longer generates unnecessary copybooks.

3226424 (1120105)

- Display statements now support the vertical bar symbol (|).

3217022 (1120020)

- If a project contained source files that were included as part of a linked folder, sometimes the resolved location of those files was being corrupted, and so the code analysis functions could not execute correctly. The required paths are now passed correctly to the compiler.

3207365 (1118363)

- An issue in Logic Analyzer where comments may not be deleted from an extracted component source file has been fixed.
- An issue that caused incorrect code generation for variable-formatted COBOL in Logic Analyzer has been fixed.
- An issue caused by the checker not generating end coordinates for the FILE SECTION in the kenlygen .xml file has been fixed.
- An issue where the REPLACING clause would sometimes be omitted from a COPY statement in code generated by Logic Analyzer has been fixed.
- An issue where Logic Analyzer could generate syntactically-incorrect code when processing free-formatted COBOL has been fixed.
- An issue with fall through in Program Control Flow when the program has multiple program entries has been fixed.
- An issue that could cause an abend on some Logic Analyzer extraction operations has been fixed.

Code Coverage

[Back to the list](#)

- Test Coverage result files containing results for different programs can now be merged correctly by the IDE.

3202218 (1117937)

- The tcreport tool (or cobtcreport on UNIX) no longer requires write permission for the .tcz test coverage results files it reads.

3197117 (1117439)

Common Communications Interface

[Back to the list](#)

- When CCI shared memory was processing multiple simultaneous broken connections and data at the same time, it was possible that the data could not be read.

3195698 (1117370)

- ssltrc.txt is no longer created with an extra character in the file extension.

Communications Server

[Back to the list](#)

- In order to mimic mainframe behavior a new CWI option has been added called "Always send options". The default is 1 and will maintain current behavior of always sending a HTTP options request when performing a CWI Open command. When set to 0 it will only send a HTTP options request as part of the CWI Open if either HttpVNum or HttpRNum are specified.
3218438 (1119912)
- A number of reflected Cross-Site Scripting (XSS) vulnerabilities have been addressed in the http-echo conversation module for Enterprise Server. Note that this module is not enabled by default.
3198822 (1117729)
- Configuration information is no longer displayed in log.html when a new connection is made with the TN3270 listener.
3185279 (1116510)
- The mfpkgage utility can now undeploy REST services.
3100111 (1108820)
- The Micro Focus zip library has been renamed from zip.dll/libzip.so to mfzip.dll/libmfzip.so, due to conflicts with other similarly-named libraries. This should not affect customer applications but will allow some customers to discontinue workarounds they had applied for these conflicts.
2864796 (1105391)
- There are no longer issues with setting some of the TLS (SSL) listener options in Enterprise Server.
- The Enterprise Server Communications Server (MFCS) now uses the same paths as the DemoCA scripts for the default locations of the server certificate and key files. If you use DemoCA (recommended for development and test purposes only) to create any key and certificate files for Enterprise Server listeners, you can specify those using unqualified filenames (such as "srvkey.pem" and "svrcert.pem") in the listener configuration.
- Enterprise Server now sets a Content Security Policy for HTTP responses that contain HTML code as well as for some responses that contain plain text (to avoid false positives from web scanners). This is to help prevent possible security exposures should new vulnerabilities in HTTP processing be found.
- The Enterprise Server service installation utility mfdepinst now accepts various command-line options for configuring the installation process.

Compiler

[Back to the list](#)

- A new Compiler directive, DPC-IN-DATA, enables you to control whether the DECIMAL-POINT IS COMMA clause (if specified) is applied to the output from the XML GENERATE and JSON GENERATE statements.
3225204 (1119993)
- Multiple undefined data items in the same statement are now all correctly detected and reported as such.
3224326 (1119891)
- STRING <national/DBCS-item> WITH POINTER no longer gives incorrect '1045-W Capacity of POINTER may be exceeded' warning message.
3224231 (1119879)
- Programs with data items that have a REDEFINES clause and are defined from typedefs now compile as expected with the INIT-BY-TYPE directive.
3224059 (1119884)
- A JSON PARSE statement will now accept a null value when the associated COBOL item is a group structure. The whole group will remain unchanged, with parsing continuing (with a non-exception json-status code).
3222416 (1119788)

- Programs that contain XML or JSON statements now compile as expected with the MF(19) Compiler directive.
3220175 (1119526)
- The compiler will now give an error message if the class condition IS NUMERIC is used on a PIC G variable.
3219148 (1119408)
- A multi-program source which contains a very large number of programs now compiles as expected and no longer produces spurious messages about memory issues.
3218772 (1119405)
- An XML GENERATE statement in a native OO program which requires the use of the REPOSITORY(UPDATE ON) directive, now generates correct xml output with the case of names preserved from the one specified in the source.
3217436 (1119293)
- Project that use stacked preprocessors, including prexml and cobsq, now show the correct colorization and copybook dependency information following multiple background parse operations.
3217164 (1119270)
- The length and byte-length intrinsic functions can now accept pointers and index-names as arguments, as described in the product documentation.
3216240 (1119197)
- Intrinsic functions such as ABS, SIGN, EXP and EXP10 are now supported under the ENTCOBOL dialect which emulates IBM's latest Enterprise Cobol release.
3215473 (1119088)
- A COMPUTE statement which followed a statement referencing a boolean data item now compiles as expected, without giving an internal error.
3215314 (1119160)
- A data name immediately followed by an opening parenthesis of an abbreviated condition now compiles successfully.
3210121 (1118623)
- Compilation of statements which reference floating-point fields with nested subscripting now produces correct object code, and executes as expected.
3209711 (1118555)
- A report file that does not have a record definition, and specifies a RECORD CONTAINS clause of larger size than the value of the REPORT-LINE directive, now produces correct report output.
3208971 (1118489)
- An inline method invoke passing a numeric literal to an ANY LENGTH parameter is now working as expected.
3206678 (1118306)
- Filenames that contain Swedish characters now appear correctly in the Visual Studio error output. This enables the subsequent error location to work correctly.
3204665 (1118778)
- A JSON GENERATE statement with a NAME clause which renames a group item in the generated json to the value of a 78 item now compiles and executes as expected.
3204281 (1118109)
- The N symbol type for VALUE clauses of 88 levels associated with a NATIONAL data item is now correctly inferred to be NATIONAL. (The preferred solution, however, is to set NSYMBOL(NATIONAL) correctly.)
3204277 (1118077)

- Provide a directive DISPLAY-AT(foreground-color background-color) to specify default colors for any ACCEPT or DISPLAY AT which does not already use a color clause. See the directive entry in the documentation for more details.
3201040 (1119380)
- COBOL words that include non-standard characters rejected by IBM's Enterprise COBOL are now similarly flagged under appropriate mainframe dialects.
3199487 (1117690)
- A UTF-8 source with the currency-sign set to the Euro symbol now compiles as expected, provided the file has a byte order marker or the ENCODING(UTF8) directive has been specified. (Note in Visual COBOL/Enterprise Developer the directive is now called SOURCE-ENCODING.)
3199087 (1117629)
- Mainframe behavior concerning what syntax is allowed prior to a REDEFINES clause in a data description entry is now better emulated under a mainframe dialect.
3195091 (1117380)
- A VALUE clause on an item defined via a typedef and compiled with the INIT-BY-TYPE directive now compiles as expected.
3194326 (1117195)
- A DISPLAY statement which uses the DISPLAY-OF intrinsic function and is compiled with the CHARSET(EBCDIC) Compiler directive, now produces the expected run time results.
3191395 (1117115)
- An ADIS DISPLAY of national data now executes as expected.
2666775 (608918)
- Previously, when profiling code, if control trickled through a GO TO DEPENDING because the value of the index variable was out-of-range, time could be counted against the wrong paragraph.
- For 390 Linux only. Given declarations: 01 a pic 9. 01 b pic 9(15)v99. a statement: move a to b could in some circumstances give an internal error 98 at generate time. This bug has been fixed.
3225211 (1120021)
- In generated code, on all platforms except Intel x86 32-bit, a very simple program (that is, one with no calls, file handling or display operations, or any complex operations) that specified DBSPACE"mixed" could give the wrong result or a 114 run-time error.
3218551 (1119351)
- An internal logic error could occur within the NCG when compiling deeply nested IF statements (more than 16 levels deep) in a program compiled with DATA-CONTEXT or PIC. This could only happen on Intel x86 platforms and with 32-bit generated code.
3218376 (1119347)
- A bug in the Intel x86 32-bit generated code for statements of the form: multiply -1 by x where x is a COMP (including COMP-4) item and the TRUNC directive specified, has been fixed.
3199580 (1117691)
- A bug in generated code has been fixed, where COMPUTE statements containing terms of the form: function numeric-function(args) * 0 where numeric-function is any numeric intrinsic function, could have unpredictable results at run time.
- If an EVALUATE with single selection subject used the WHEN ANY syntax, bad code could result. This is now fixed. Although the use of WHEN ANY in such a context is legal, we recommend you instead use WHEN OTHER. If the WHEN ANY was the last WHEN branch of the EVALUATE, it can simply be changed to WHEN OTHER. If it was not the last branch of the EVALUATE, then any following branches would never be reached, and can be deleted.
3220298 (1119515)

- A level 88 condition name associated with a sliding data item in the linkage section was producing bad code and system errors.
3214482 (1119037)
- A system error no longer occurs when attempting to find a method in a class, in the case where an override of that method has a parameter of an unknown type (that is, a type which is not on the class path).
3212502 (1118804)
- When a program is compiled for JVM, for methods including lines whose sequential line number exceeds 65536, an annotation `com.microfocus.cobol.info.LineBias` is now added which has an integer value. This value indicates the increment which you must add to the line numbers reported by an exception, in order to find the true line number of the statement that caused the exception.
3211681 (1118851)
- A `LineBias` annotation (with an integer value) is now present for debuggable methods and procedures, where the last statement of the method is on a line whose line number is greater than or equal to 65534. This value may be used to deduce the true line number for a statement within the method, based on the line number in the `LineNumberTable`.
3211681 (1119613)
- Use of a property as a subscript for an operand used as a target (e.g. the target of a SET statement) could lead to spurious errors.
3202739 (1117970)
- When compiling for JVM, if a program or project has a reference to another project whose path contains non-ANSI characters, the system now correctly finds classes on that path.
3198280 (1117549)
- When compiling for JVM, setting a decimal field (i.e. a field defined using the keyword 'decimal' or explicitly with type `java.lang.Decimal`) to a floating-point data item, no longer produces invalid code.
3195996 (1117327)
- If a VALUE is associated with a sliding data item, you will receive error COBCH1962. Contact SupportLine for help on resolving this.

Data Tools

[Back to the list](#)

- The `dfconv` command line utility now supports a new option "-s" - this option skips DBCS checking during conversion, in order to improve performance. This option should only be used from within a DBCS locale, and only when you are sure that the data you are dealing with is from a SBCS.
3213092 (1118872)
- When running the `DFCONV` command line batch interface, a new option -F (or -f) allows only the fixed text output to display; no dynamic updates are displayed to the console after each record is processed.
3163542 (1115730)
- Trying to open a PDS file in `DFED` no longer results in out-of-bounds exceptions.
3214578 (1119499)
- On UNIX, opening empty structure files no longer fails and produces an RTS 114 error message.
3208560 (1118685)
- Structure files can now be loaded and unloaded after a data file has been opened.
3181265 (1116352)
- On UNIX, using the Up and Down buttons to navigate the records no longer causes Data Tools to hang and loop at several rows.
3208560 (1118686)

- Conditional structure now work with EBCDIC files where the condition field is not at the beginning of the record.

3204158 (1118166)

Debugging

[Back to the list](#)

- When animating programs where the source name differs from the program name, breakpoints are now set correctly.

3210556 (1118743)

- The debug option 'Only stop on breakpoints' in Eclipse used during Enterprise Server debugging now works correctly.

3201358 (1117960)

- Attaching the debugger to a running process is now quicker than previously.

3198107 (1117569)

- When zooming over applications with many programs which have many COPY statements, performance is improved.

3197159 (1117509)

- Values of sliding variables are now presented properly while debugging.

3219710 (1119601)

Dialog System

[Back to the list](#)

- The Export process in Dialog System no longer fails with RTS164 error.

3200921 (1117781)

Dockerfiles

[Back to the list](#)

- esadm is the default user for all the different container images.

Documentation

[Back to the list](#)

- The documentation has been updated to explicitly state that the FOLDER tag, used in extfh.cfg, only supports the use of local folders; it does not support the use of networked folders.

3212247 (1118782)

- The documentation has been corrected in relation to the supported data types allowed in a stored procedure definition file.

3207946 (1118435)

- The note at the head of the list of run-time tunables, stating that the tunables are for native code only, has been removed. Any native-only restrictions for tunables are mentioned in the topics of each tunable.

3207815 (1118381)

- The error message description for the warning message COBCH1237 has been corrected. It also now contains a link to the Compiler directive topic (REENTRANT) that it relates to.

3205344 (1118169)

- The product Help for the software requirements has been updated to indicate that on 64-bit Red Hat 7 you only need to install glibc-2.17*.x86_64 and glibc-2.17*.i686.

3201443 (1118038)

- The cblink option -s has been correctly removed from the documentation.

3200100 (1117719)

- To create an EXTENDEDES file, the docs now state that you must use a combination of `IDXFORMAT"15"` and the `EXTENDEDES` option.

3195595 (1117298)

- The syntax diagram for indexed file formats (format 4) has been updated in the documentation - topic: The File Control Entry. It now indicates that `WITH [NO] DUPLICATES` can be specified on the record key, as an MF extension.

3177534 (1115898)

- When using Just-In-Time debugging with Eclipse, a confirmation prompt can be displayed, asking for confirmation before Eclipse is launched.

3167492 (1115034)

- The documentation on the `FILE_TRACE` configuration variable (used within Database Connectors) now includes details on the level of tracing that is possible.

3164533 (1117209)

- The Restrictions that appeared on all IMTK topics indicating that the topics applied to Windows (local development) only have either been removed or updated to reflect Windows only.

3164533 (1115095)

- The RM/COBOL compatibility documentation now makes it clear that the `DIALECT"RM"` directive should not be applied to managed COBOL.

3139755 (1112643)

- The documentation now includes the sequence in which the Run-Time System will attempt to locate a requested .lng file - see 'Compiling and Deploying a Message File'

2869115 (1106127)

- The documentation has been corrected with regards to one of the parameter names used with the `.cobolBuild` script used with Apache Ant. The correct parameter name (previously stated as `threadCount`) is `mf.buildThreadCount`.
- The context-sensitive reserved words, particularly those relating to the ACU dialect, have been relocated to the Context-Sensitive Reserved Words topic. (They previously resided in the Reserved Words Table topic.)
- The explanation of parameter prefix substitution in the MFBSI configuration file has been clarified in the documentation.
- If you are building a self-contained callable shared object on a Linux platform, and will be calling COBOL modules built to `.int` or `.gnt` files, you must specify the following additional options when you link the main (non-COBOL) executable: `-Wl,-zexecstack` For example: `gcc -m32 -o mymainexe mymain.o -g -ldl -Wl,-zexecstack`
- Erroneous text re: background syntax checking, in the 'Editing Standalone Files' section of the topic 'Writing Code Efficiently in the COBOL Editor', has been removed.
- The 'Unit Testing from the Command Line' section of the MFUnit documentation now contains a list of possible error codes generated when running tests from the command line.
- The documentation has been updated to clarify the default behavior when the `ALIGN` directive is specified without either `OPT` or `FIXED`.
- The documentation for the Micro Focus Database Handler now clarifies when a region and cross-region database is required (in the Configuration Requirements section).
- The sample code listed in 'Typedef - User Defined USAGE or Structure' has been corrected.
- The documentation has been corrected for the `TYPedef` clause - the list of clauses not permitted for use when `TYPedef` is specified is now accurate.
- The documentation has been updated to state that the maximum number of `PERFORM` ranges in a program (65535) is also applicable to `.NET` and `JVM COBOL` programs.

- COBOL cheat sheets have now been successfully re-instated.
- All erroneous references to the TRUNC, BS2000-OFFLOAD, and INFORETURN directives have been removed from the documentation.
3223245 (1119786)
- All erroneous references to the FLAGCD directive have been removed from the documentation.
3223242 (1119785)
- All erroneous references to the [NO]OLDSTRSUB directive have been removed from the documentation.
3223240 (1119783)
- On UNIX, MFDS can run as a non-root user on a port number equal or greater than 1024. See "To Run the Directory Server as a Non-Root User" in your product Help for more information.
3213301 (1118928)
- The documented example for the mf.mfdbfh CTF component now contains the correct settings in order for the trace to be successful.
3203127 (1118015)
- The documentation has now been updated with the correct definition for the CCITCPS_fsname variable, used within Fileshare.
3192544 (1117368)
- The DD Statements topic has been updated to include correct values for XTEP2 and its alias DSNTEP2.
3168080 (1115120)
- The Interface Mapping Toolkit topic under Known Issues and Restrictions has been updated to clarify support for the ODOSLIDE compiler directive.
3152222 (1113733)
- The documentation now correctly states that the CBL_CREATE_CORE library routine is for native COBOL use only.
- Ensure that you back up your secrets configuration file, secrets.cfg. Before you install a new version of your product. By default, the secrets.cfg file is located in the %ProgramFiles(x86)%\Micro Focus \Enterprise Developer\etc (Windows) or \$COBDIR/etc (UNIX) directory. Restore the backed up configuration file once the product installation is complete.
3216092 (1119162)
- The documentation now includes details of the MFJ_STRICT_CASE environment variable, which can be used to maintain the case of physical file names passed to MVSCATIO by the catalog API, and other utilities.

Enterprise Server

[Back to the list](#)

- TS queues that were created with an expiry interval and stored in Redis would have their expiry interval corrupted when a subsequent READQ TS was performed on that queue. The expiry interval is no longer modified during the life of the queue.
3221103 (1119598)
- In a PAC, when a JES initiator was terminated, if the job was in the Dispatch queue the lock was not removed for the dispatch queue SYSZJOBID.
3226274 (1120084)
- It is now possible to use casfile -p to change the current path of a closed file or, if the file is cataloged, to change the DSNNAME from the specified DD NAME.
3224800 (1119969)

- An issue causing an RTS 114 on DFSRRC00 related to disabled xa entries has been resolved.
3223838 (1119845)
- You can now set the environment variable ES_PAC_NO_GLOBAL_LOG=Y if you do not want all the messages from all console.log files for all the regions in a PAC to be stored in the PSOR CasPacLog.
3222549 (1119714)
- CICS Web requests greater than 32 Kb to secure regions no longer incorrectly receive a 403 (Forbidden) response.
3222308 (1119752)
- Switching on the active HSF file could cause a thread in the castrc process to go into a tight loop and use a lot of CPU.
3219692 (1119546)
- Enterprise Server was always attempting to verify if a called program was a PL/I one or not even when the PL/I option was not active for the region.
3219147 (1119409)
- A MalformedResponseException error when using channels and containers on ECI calls has been resolved.
3217992 (1119653)
- Strings with special characters were sometimes being truncated or causing a malformed XML error. The whole string is now being returned without any truncation or errors.
3217170 (1119681)
- A CCSID Error 0002 could occur when converting certain strings to UTF-8, if the strings contain characters that expand from single to multi-byte during the conversion. The reason for this was that the converted string was longer than the maximum length specified for the field. Instead of resulting in an error, the data is now truncated. This matches the behavior on the mainframe.
3217170 (1119262)
- The Historical Statistics Facility (HSF) post-processor utility casfhsf has been enhanced to output time intervals of from 1 to 9999 seconds. An option is now provided to optionally split the date/time output column into a date column and a time column. The maximum number of columns has been increased to 172,800 for 32-bit systems, and to 1,296,000 for 64-bit systems. The number of transactions within an interval that meet its specified system response time criteria is now reported correctly.
3214504 (1119179)
- Calling into an entry point on an already loaded program no longer causes memory leaks.
3214021 (1119003)
- An empty XML element in the SOAP response message no longer results in an ARRAY_TOO_SMALL error.
3212477 (1118802)
- Tranclass MaxActive is now honoured in PAC configurations.
3209901 (1118571)
- Micro Focus now supports IBM's GMTRAN system initialization parameter in CICS SIT, which enables you to disconnect a CESN transaction. GMTRAN enables you to specify the outcome of pressing F3 or CLEAR on the CICS Signon transaction CESN/CESL. This is either EXIT (the default) or DISCONNECT (disconnects the TN3270 terminal from the region).
3209820 (1118562)
- The command line help for casstart now includes information about the /m option.
3208071 (1118414)
- The initialization of a Service Execution Process could be interrupted by a request which provoked a security call before the local ESM context had been established. This resulted in an error which would cause the server to shutdown immediately. This has been fixed.

3208021 (1118431)

- An issue on a START TRANSID with TERMID executed from an EBCDIC program has been fixed.

3206507 (1118272)

- The permissions for resources (such as TSQUEUE) were being checked every time they were used in a transaction. Now they are checked once per transaction and the result of that check is used on subsequent requests.

3206471 (1118690)

- All BATCHONLY MQ resource managers accessed from the same DSNRLI program are now security checked. Note that DSNRLI is limited to opening only one MQ resource at a time.

3205339 (1118173)

- When running in a secure region, if USERID was specified on an EXEC CICS START command, the target user and the rights of the user of the active transaction to operate as a surrogate for that user were not being verified correctly. This resulted in the started transaction executing under the default CICS user credentials. This has been fixed.

3204696 (1118150)

- A WEB HTTPHEADER command now returns INVREQ when used without a SESSTOKEN in a non-CICS Web Server application.

3202999 (1118298)

- If one or more jobs had a shared lock on a dataset (DISP=SHR) and another job was waiting for exclusive access (DISP=OLD) on the same dataset, the latter would be granted the lock when any one of the other jobs completed. The file would not be available for exclusive use and this would result in a 9/65 error, file locked status on open. This has now been resolved and the exclusive lock is not granted until all shared locks have been released.

3201463 (1117839)

- Previously, INQ TRANCLASS could fail and return a TCIDERR response code if CASTSC was handling a heavy load.

3200414 (1117738)

- ITR requests (such as file requests) are not sent to the transient SEP running the EZASOKET CICS transaction.

3200370 (1117767)

- Invoking any of the CAS* utilities (such as casout) against an enterprise server instance running on a machine with a host name which exceeds 40 characters in length no longer results in a failure to find the service.

3200011 (1117816)

- Previously, a high volume of events in the system could cause shared memory constraints. This was because the system generated the events irrespective of what the event manager exits were checking for. It is now possible to avoid this by setting the filter strings in the event manager exits. This ensures that only the required events are generated and helps to avoid any further shared memory constraints.

3199174 (1117679)

- Previously, a high volume of events in the system could cause shared memory constraints. This was because the system generated the events irrespective of what the event manager exits were checking for. It is now possible to avoid this by setting the filter strings in the event manager exits. This ensures that only the required events are generated and helps to avoid any further shared memory constraints.

3199174 (1117680)

- ESCERTPAS can now return spaces as the passphrase to allow for certificates that do not have a passphrase.

3196872 (1117431)

- The following APIs are now supported: MQCRTMH, MQBUFMH, MQMHBUF, MQDLTMH MQSETMP, MQINQMP, and MQDLTMP.

3196430 (1117373)

- The performance when accessing PPTs for a program that has already been invoked in the same task has been improved.

3195445 (1117554)

- In the case of OPERCMDS, you need to call the security exit only if the esm-input-parms pointer has been provided. This helps to avoid receiving an RTS 114 error message.

3195205 (1117377)

- An issue where a process recovery caused the entire region to crash has been resolved.

3192471 (1117060)

- Sysout output from the casout utility larger than 64K is now displayed correctly on the screen.

3192406 (1117734)

- Previously, console.000 was always overwritten when console.log max size was specified.

3192214 (1117565)

- In MQ series support, the MQCSP block which can be passed on an MQCONN call and carries user credentials, was not being converted. This resulted in MQ connection failures.

3191698 (1117032)

- When an alternate user ID is supplied on an MQ call, it is now authorized against the server's active ESMs.

3183523 (1117005)

- Under certain circumstances, a batch job which used EZSOKET calls could abend for exceeding its job card's TIME parameter before that period had expired.

3181745 (1116242)

- The association of a XA switch module with a batch unit of work now returns an error if the XAR cannot be associated. This change might affect DSNRLI, DSNALI, and TSO in Batch(IKJEFTxx) processing.

3178489 (1118208)

- The fixed transaction property for a terminal resource was not being honored correctly.

3176086 (1115790)

- An intermittent issue with SSTM jobs not running after the region has started has been resolved.

3175925 (1115789)

- An intermittent issue was introduced in 5.0 Patch Update 2 where CICS could release a SYSZDSN ENQ prematurely at FCT close, before all SEPs had physically closed the file. If a batch job was waiting on the same ENQ, it was possible that the job could get a 9/065 status on the file if it was accessed prior to all SEPs completing the close. This has been fixed.
- HSF records following a date rollover are no longer intermittently recorded as occurring on the previous day.
- An issue which caused a memory corruption on shutdown when using JCL HSF has been resolved.
- Hexadecimal prefixes can now be defined in Scale-Out Repository (SOR) models. See "PAC and SOR Environment Variables" in your product Help for more information. A new exit, TSTDSRUE, has been provided to determine whether or not to direct a TS or TD access request to a SOR at queue access time. Usage of this exit causes any SOR models that have been defined to be ignored. See "Configuring TS and TD Queues for SOR Storage" in your product Help for more information.
- The XML export of resource definitions now ignores any resources that are in groups that have names starting with "DFH".
- A lock serialization no longer occurs on PAC Tranclass.

3222098 (1119677)

- A problem that occurred in castsc when running a transaction that had an unknown tranclass caused an RTS114 error. This has been corrected.

3220668 (1119647)

- A crash could sometimes occur in an enterprise server in a PAC configuration under heavy load. This has been resolved.
3220040 (1119490)
- When using EXEC CICS START with DATA in a PAC environment, a memory leak could cause the SEP to crash.
3218858 (1119389)
- Entries in the local PPT counters table were not being correctly removed, and the table was not properly reduced in size when the extra space was no longer needed. These issues have been corrected.
3217950 (1119349)
- Latency displayed on the monitor page for transactions initiated using the START API showed as incorrectly high. This has been corrected.
3215297 (1119128)
- Support has been added for the following TSMODEL attributes: REMOTESYSTEM REMOTEPREFIX XREMOTEPFX RECOVERY(YES) Support has been added for the RECOVSTATUS option on the INQUIRE TSQUEUE/TSQNAME commands.
3214937 (1119043)
- An issue with the processing of inbound QUEUE model requests flowing over APPC has been resolved. You must upgrade the resource definition file for the new CSM3 transaction to be made available to the system as part of the DFHISC group. To upgrade your resource definition file (dfhdrdat), execute the caspcupg command.
3214659 (1119015)
- An RTS114 error that occurred when running an ESMAC DUMP while one or more channels were in transit has been fixed.
3213819 (1119378)
- A problem that caused a TRANCLASS CLASS display request to intermittently return invalid characters has been fixed.
3213819 (1119424)
- An issue where Dynamic XA processing, invoked by MFDS and CRCN, could result in connection loss if the same switch was handling several connections has been resolved.
3212594 (1118814)
- On region shut-down, if CRCN was in the reconnect state, it would hang and the region would not shut down.
3212564 (1118813)
- EXEC CICS INQUIRE ASSOCIATION is an unsupported API. Use CICSECM(FUNC=NOOP) for your programs to compile.
3212245 (1119025)
- When a COMMAREA override was set, an RTS205 error occurred in started transactions compiled to AMODE. This has been fixed.
3211712 (1118759)
- A problem that caused an intermittent NOSPAC error on WRITEQ TS has been resolved.
3204706 (1118216)
- When an EXEC CICS START specified a CHANNEL, memory was being allocated by the task performing the start, but this was not being freed. If this was a long-running task performing many STARTs, it was possible for the process to exhaust available memory. Storage housekeeping has been improved to ensure that this no longer occurs.
3203094 (1118042)

- If an FCT for an alternative index was opened, and the primary FCT was subsequently opened in the same task, the FCT file for the alternative index was left open after both FCTs were marked as closed. This has been fixed.
3200676 (1117802)
- The import and export process of resource definitions now takes into account all SIT cold start flags.
3196670 (1117418)
- Micro Focus ECI support now supports user IDs and passwords that are greater than eight characters in length. See "Micro Focus External Call Interface" in the product Help for more details.
3195078 (1117382)
- HSF records for CICS transactions that are STARTed now have a valid latency value. Previously, the latency calculation was disabled and would always be 1 for STARTed transactions.
3194297 (1117182)
- A data loss issue has been resolved where TRANCLASS is enabled and a read and a write transaction for a protected Intra-Partition Transient data Queue commit concurrently.
3193323 (1117117)
- JSON data was being generated incorrectly when there was only one element in a JSON array item.
3192433 (1117035)
- When an internal PPT management table no longer has enough space to store its data a new larger block is allocated. Previously this would result in the creation of a dump for diagnostic purposes. Whether to generate the dump is now configurable using the environment variable ES_PPTL_DIAG=Y. You should use this if you are instructed to do so by Micro Focus support.
3191382 (1117066)
- A problem that caused the Micro Focus Communications Server (MFCS) to fail when the application sent 3270 control byte characters as data to the screen has been fixed.
3187441 (1116874)
- An additional option for nowait has been added to castran and CNCL. In the case of castran specify: !castran -v<program>,nw! For CNCL specify: CNCL <program> NW
3182587 (1116313)
- The casfile /p parameter can now change the current path of a closed file or, if the file is cataloged, change the DSNNAME from the specified DD NAME.
- Security Fix: A vulnerability within ESMAC which made the Web UI more susceptible to reverse tabnabbing has been removed.
3216053 (1119150)
- If MFDS_DNS_RESOLVE=Y is set, the resolved hostname of the requested address for a listener is used for the ESMAC URL from MFDS, even if the listener is specified with an IP address in the listener definition.
3194907 (1117388)
- Some issues with sorting jobs on the spool page have been resolved.
3194166 (1117179)
- ITRs are now routed to the target SEP via castsc.
3193937 (1117152)
- An issue with Reply to console page in ESMAC has been fixed.
3192888 (1117078)
- Spool SYSPRINT files stored in DB can now be viewed as expected. An issue where the file was corrupted/overwritten when viewed in ESMAC has been resolved.
- The ESXDBOPC RM switch module has been updated to provide further clarification for optional open-string customization.

3223990 (1119899)

- A new XA Switch build option - mssql17 - allows the use of the SQL Server ODBC 17.3 driver (and later versions).

3220548 (1119748)

- APPLNAME is now set when DSNRLI SIGNON is called with an argument.

3219384 (1119464)

- After a SRRCMIT/SRRBACK call, the connection is now being set correctly.

3218880 (1119427)

- The ODBC XA switch now initializes and starts correctly when MFDBFH is enabled.

3218343 (1119410)

- There is no longer an issue with running an XA job after cancelling an XA job in ESMAC.

3218095 (1119496)

- New functionality now enables you to store all or part of an XA open string in a vault using the Micro Focus Vault Facility.

3217806 (1119289)

- The ODBC switch now handles IMS BMP jobs correctly when the BATCHONLY=T option is specified.

3212998 (1119040)

- XAR now uses the long username for connections during user impersonation if the new open string option LNAME=T is specified.

3203042 (1117973)

- The XA module for XDB now builds without any issues in the Enterprise Developer 5.0 products.

3199440 (1117649)

- XA switch modules now recognize IMS transactions correctly.

3198981 (1117710)

- The DB2 XA switch module now handles user impersonation and the packagepath option correctly.

3166472 (1118325)

Enterprise Server Auditing

[Back to the list](#)

- Enterprise Server auditing no longer hangs if auditing is enabled for the External Security Facility but no audit configuration file is present, and the Audit Manager is not running.

Enterprise Server Common Web Administration

[Back to the list](#)

- An issue with viewing regions in ESCWA using an MF Directory Server process secured with the Micro Focus Internal Security has been resolved.
- When editing the IMS properties of a region in the ESCWA GUI, it was not possible to set the IMS Codeset Bias to "ASCII" and the IMS Attribute Bias to "Binary".
- The ESCWA user interface now performs validation in the same way as the Enterprise Server MFDS.

3194067 (1117163)

- It is now possible to add a color to a directory server's region through its General> Appearance drop-down list. This enables you to change the color of the region in the tree, and the background color of the region's pages. This setting overrides the directory server's colors, if they were already set.

3132670 (1111980)

- It is now possible to add a color to a directory server from the server's General > Appearance drop-down setting. Use this setting to change the color of the directory server in the tree, in the background color of the directory server pages and all of its region pages.

2869809 (1105847)

- The Monitor > Properties page now displays the list of Pending Requests under counts. This represents any type of pending requests for the region.

Enterprise Server Security

[Back to the list](#)

- mfsecretsadmin no longer fails on HP-UX platforms.
- The mfsecretsadmin utility now supports specific secrets configuration files.
- Invalid keys in mfsecrets no longer result in a crash.
- mfsecretsadmin no longer incorrectly displays an error message when writing to a directory that does not exist.
- The secrets.cfg file has been moved to the default vault location.
- Enterprise Server mainframe-style passtickets, used by the ELF and DCAS features, are now supported when LDAP bind-mode verification is used.

3223436 (1119810)

- In Enterprise Server, the External Security Facility's OS ESM module now supports the Enterprise Server Digital Certificate Authentication Service (DCAS).

3222786 (1119760)

- An Enterprise Server region running in a PAC and using MFDBFH for the region database with the database "reslocking" feature supported, and with the External Security Feature enabled, would periodically log messages similar to "ESFEV0331E Unable to unlock shared memory".

3218610 (1119357)

- An additional configuration option related to retrying on failure, retry bind, has been added to the MLDAP ESM Module. See MLDAP ESM Module Custom Configuration Information topic in your product Help for more information.

3215526 (1119267)

- The Enterprise Server External Security Facility's rule-substitution feature now supports the token \$ {user_long}, which is replaced with the user's "long name".

3210400 (1118613)

- In the Enterprise Server External Security Facility's administration, in rare circumstances, a one-byte buffer overflow could occur when processing a list-user request, potentially resulting in heap corruption.

3209383 (1118627)

- In an Enterprise Server security configuration with two or more security managers using the MLDAP ESM Module, all-groups mode enabled, and group federation enabled, certain ESF Update requests including the "Update All" button in the Enterprise Server Administration web interface could result in users losing group membership information. This has now been fixed.

3208297 (1118513)

- Enterprise Server's MLDAP ESM Module has a new option, "maximum qualifiers for initial check", which enhances the existing "check TLQ first" option. See "MLDAP ESM Module Custom Configuration Information" in your product Help for more information.

3201021 (1117790)

- The Enterprise Server MLDAP ESM Module's tracing of the effective rule and result for Auth/XAuth requests now includes the resource class as well as name.

3200710 (1117799)

- In Enterprise Server security configurations using multiple Security Managers with the MLDAP ESM Module, where all-groups mode is enabled and federation is disabled, user group membership is now maintained correctly.
3194825 (1117275)
- The MLDAP ESM Module no longer generates "invalid search filter" errors when using OpenLDAP to search for users with special characters in their LDAP Distinguished Names.
3194796 (1117268)
- Enterprise Server on Linux now includes a PAM ESM Module, which can authenticate users using the Pluggable Authentication Modules mechanism included with the operating system.
3176983 (1115874)
- An issue with modifying Enterprise Server user groups with names beginning with the hash character ("#") has been corrected.
- An issue with some identifiers that contain the equals sign character ("=") when using LDAP-based security in Enterprise Server has been resolved.
- es_default_ldap_openldap.ldf no longer deletes entries from the specified LDAP server. Instead, if you are performing an upgrade you can use the new es_default_delete_ldap_openldap.ldf to delete these old entries.

File Handling

[Back to the list](#)

- An OPEN OUTPUT operation on an ESDS file, with directive NOFCD3 set, now correctly returns a 00 status.
3224463 (1119982)
- A file status of 9/41 was sometimes incorrectly reported when a file was accessed by many users, under intensive file I-O. This has now been fixed.
3214504 (1119352)
- Any 9/41 additional status errors will not be logged to XFHLOG if /dev/null or NUL is used.
3214504 (1119652)
- The File Handler running under Enterprise Server no longer returns a file status 500 when trying to retrieve the next DD.
3211622 (1119086)
- Specifying OUTDD"SYSOUT 121 R" when MF_CBLQDA=ON is set could cause a file locked status for SYSOUT to occur.
3201420 (1117813)
- Fileshare no longer crashes when run in background mode and signal is processed.
- Rebuild now correctly reports the permitted number of duplicates for idxformat 12.
3201916 (1117985)
- The COUNT=(to) process no longer results in a 114 error.
3225165 (1119987)
- A SORT on a fixed sequential file sometimes did not return an error when the last record in the file was only a partial record.
3224574 (1119918)
- OMIT=(ALL) parameter now works as expected and omits all records.
3221340 (1119623)
- C'XX' now works with sort-ebcdic.
3220079 (1119548)

- The INREC statement is now working correctly on VB input files with the option FIELDS=(p). This option specifies using record data from p offset to the end of the record.
3219329 (1119458)
- Validation errors are no longer thrown in mfsort when using conversion FS, TO=PD or TO=ZD.
3217843 (1119512)
- Conversion LS,TO=PD or TO=ZD will no longer generate validation errors.
3217843 (1119644)
- MFSORT merge no longer corrupts the record when being used with INCLUDE/OMIT or INREC.
3217580 (1119277)
- The BLKCCH1 and BLKCCH2 keywords of OUTFIL are now supported. The page eject indicator character '1' will be replaced by a blank space according to the option which is specified.
3216086 (1119205)
- When sorting an LSEQ file in a region running in EBCDIC, if the record format of the output file was not specified, it would correctly create an LSEQ output file, but the contents were incorrectly converted to EBCDIC - this has now been corrected.
3212662 (1118873)
- The INCLUDE and OMIT statements now work as expected against records inserted by an E15 routine.
3210188 (1118589)
- SORT TRAILER that contains COUNT=(TO) no longer causes JCL to abend with an RTS 114.
3204104 (1118058)
- The emulation of ICETOOL SPLICE KEEPNOUDUPS no longer gives duplicate output records.
3201555 (1117836)
- SORT VLFILL parameter no longer saves the value from the previous execution on UNIX platforms.
3191730 (1116986)
- Enterprise Server XA reconnections failed to register with MFDBFH following the loss of the original connections - for example, through the use of the Db2 FORCE APPLICATIONS ALL.
3226856 (1120160)
- Error messages are now reported to the Enterprise Server console, and the region start-up fails, if an attempt is made to warm start a region using a region database that had not previously been cold started.
3226448 (1120167)
- A trace event is now output each time an I/O operation occurs that requires an XA connection and no XA connection for the underlying datastore has been registered. This is designed to help with diagnosing any file access problems.
3222022 (1119691)
- Specifying "localhost" as the hostname to recover when using "dbfhadmin -openfiles -recover -host:localhost" or "dbfhadmin -casprocess -recover -host:localhost" failed to resolve to the current machine name, resulting in the command failing.
3221354 (1119628)
- dbfhdeploy was not reporting the underlying ODBC error that resulted from a database connection failure.
3221103 (1119661)
- If a single Db2 database hosted a datastore and a region with the same name, database operations would fail for the region if the datastore had been accessed first (and vice versa) due to the same database connection and schema being used for both the region and the datastore.
3219905 (1119487)

- The Micro Focus Database File Handler (MFDBFH) documentation now includes a reference topic listing the database permissions required to create new databases, and to handle data files stored in a database. Administrators can use this information when setting up roles within their database instances.
3217410 (1119273)
- DB2 support has been added to MFDBFH.
3203127 (1117981)
- dbfhdeploy can now be used to download files that are opened for read-only access by other processes. Previously, you could only download only files that were not open by other processes.
3202402 (1117910)
- When using a Db2 MFDBFH datastore, an exception occurred when attempting to lock an already locked record.
- dbfhadmin did not output an error message to indicate that the specified datastore URL (specified by the -datastore: command-line option) did not have a corresponding configuration entry in the MFDBFH.config file.
- When using PostgreSQL, when a KSDS file was deleted, the associated rewrite stored procedure was not being removed.
- CAS processes using database resource locking no longer crash with a primary key constraint error when attempting to create global locks.
- dbfhdeploy was incorrectly reporting a 3/0 file status (I/O error) when downloading a file locked by CICS. A 9/65 error (File Locked) is now reported.
- An RTS 114 error occurred when copying a database-hosted file to another database-hosted file if either the source or destination file URLs specified a datastore for which there was not an MFDBFH configuration file entry.
- "dbfhadmin -openfiles -recover" was incorrectly reporting that no files had been closed when the open files were in the root folder.
- JCL IDCAMS steps that define alternate keys used to fail for database-hosted files.
- Deleting a large number of files in a single operation sometimes failed due to the database's transaction log becoming full when using a DB2 MFDBFH datastore.
- An error message RTS 114 could occur during CASCD termination when the ES_DB_SERVER environment variable had been set, but no associated region database was configured.
- The "dbfhdeploy delete" command has been enhanced to allow the deletion of a folder (and all of its sub-folders and files), and to allow the deletion of multiple files in a folder using a filename filter (such as replacing characters in a file name using a wildcard, '*', and/or a question mark, '?').
- Reading a record from a transactional file hosted in a PostgreSQL would hang if that record had previously been written within the same CICS transaction.
- The dbfhadmin command line utility now allows you to list/free region resources that are still locked after a system failure. Use dbfhadmin -region -list|-recover
- EXEC CICS READQ TD performance was slow when the TD queue was hosted in a DB2 database.
- Active TDQs hosted in MFDBFH datastores were not displayed by ESMAC if they had records locked by a concurrently running transaction.
- CASSI processes would sometimes hang on termination, following a previous soft kill of a job, when Db2 datastores were being used.
- A new command line utility - dbfhconfig - enables you to build and maintain a database configuration file, meaning that you are no longer required to hand-craft the file. You can also use a secrets vault to store sensitive logon credentials , instead of these being on view in a configuration file. Finally, a CTF trace can be configured to trace ODBC and vault-related operations.
- This product now includes the dbfhconfig utility. It enables you to create and maintain an MFDBFH configuration file eliminating the need to manually edit the XML file. Optionally, you can use dbfhconfig to add any passwords and connection strings associated with DSN entries to the product's secrets vault.
- Cancelling a job which was waiting for an ENQ did not always remove the ENQ request from the (cross-)region database.

- MFDBFH no longer fails if the MFDBFH_SCRIPT_DIR and/or MFDBFH_CONFIG environment variables specify a quoted path name.
- Unpredictable results could occur for applications with files open in two or more datastores due to a clash of file handles.
- It is now possible to switch on/off I/O file optimization when deploying files via the dbfhdeploy command. Also, file optimization is now available for ESDS, KSDS, and RRDS files hosted in a database, that are opened for input - add optio="+oi" to mfdbfh.cfg to enable.
- MFDBFH now automatically reconnects the Db2 datastore and any (cross-)region database connections when they are lost.
- Intermittent ODBC errors could occur during JES initialization after the termination of an initiator process running a job in a previous session.
- dbfhdeploy incorrectly reported that a datastore did not exist for SQL Server operations when the "master" database had not been configured. A similar issue occurred for PostgreSQL datastores when the "postgres" database had not been configured.

Form Designer

[Back to the list](#)

- 64-bit versions of nmcnvrti.obj and nmcnvrtto.obj have been added.
3207452 (1118373)

Header-to-Copy Utility

[Back to the list](#)

- h2cpy could produce an RTS 114 error if the number of DEFINES was greater than 167.
3220579 (1119558)

IDE

[Back to the list](#)

- The incremental build processing for BMS was not correctly handling alternate output locations to the main output folder. Incremental build worked if everything was going into the same output folder. This has now been fixed.
3225243 (1120031)
- Images in the IDE are now correctly auto-scaled on high-resolution DPI.
3224931 (1119997)
- When using the Eclipse IDE to create data-driven unit tests that have a csv file with a header greater than 511 bytes the test creation would fail. This has been fixed.
3223772 (1119829)
- An issue related to how copypaths for copybooks in linked folders are set up has been fixed.
3218555 (1119493)
- An issue related to how copybook paths are set up in the user environment settings has been resolved.
3217472 (1119287)
- COBOL programs located in linked folders were not finding the correct .mfdirset file when using a single file compile. This has now been fixed.
3216339 (1119355)
- A problem preventing deserializing the runtime configuration xml has been fixed.
3214678 (1119016)
- Enterprise Developer and Visual COBOL can now parse XML generated by the Compiler when creating a Web Service that contains the value "zero" when previously it could only process the numeric value.

3214559 (1118996)

- Web service mapping for both SOAP and REST web services is now mostly consistent between default and manual mapping. The exception being types like zz9, which will remain "string" for SOAP web services and "number" for REST web services. You can override this if required, using the field properties to set correct field type.

3214314 (1119002)

- Resolving copybook paths resulted in the format program feature failing. This has been fixed.

3214035 (1118969)

- The mfdirset files for SQL programs are no longer generated upon project reload.

3212007 (1118810)

- You can now use the shortcut keys Ctrl+Shift+Z to compile single file JVM COBOL projects.

3211812 (1118772)

- Micro Focus recommends that you do not use a linked folder as an output folder, this can result in unexpected project behavior. Such as, project files being deleted or overwritten.

3210830 (1119232)

- When creating a new Remote Java Application debug configuration, if you clicked on the Source tab and then Add, a duplicate Remote File System Directory folder would be displayed. This has now been fixed.

3210830 (1119234)

- When adding a project dependency (such as a copybook project) that resided in a folder not named the same as the project, the assets were not found at compile time or when performing a background parse. This has now been fixed.

3210496 (1119035)

- The derived flag is now set correctly when the output folder is a sub-folder.

3208391 (1118448)

- The Compile file context menu option is now available for secondary source files.

3208344 (1118443)

- Debugging of JVM COBOL sources located using a path containing spaces no longer throws errors.

3208193 (1118531)

- Opening a copy file in the COBOL editor which contained multiple error markers might degrade performance. This has now been fixed.

3207063 (1118471)

- Performing a Ctrl + mouse click on a variable during two-pane editing no longer causes Eclipse to throw an exception.

3206046 (1118403)

- A Net Express project which contained Windows resource files were incorrectly converted to a COBOL project. In addition, character corruption occurred in the converted build configurations. These have now been fixed.

3205337 (1118167)

- .mfdirset files for COBOL programs in linked folders are now loaded from the correct .settings folder under the project when using single file compile.

3204894 (1118133)

- The environment variable COBPATH was not being inherited from the correct locations. This has now been fixed.

3204315 (1118116)

- A rare issues with some machines could occur where the machine could have difficulty interacting with the code analysis services. This has been resolved by upgrading the internal Web service client software.

3204257 (1118076)

- Null Pointer Exception is no longer received when Eclipse executes the "determine directives" command.

3203931 (1118127)

- SourceConnect file filtering is now working correctly: case-insensitive filter strings can now be used, and the "Show files only" option is respected.

3202067 (1117895)

- A project created with a 4.0 or earlier product version and which contained COBOL CICS settings was incorrectly upgraded to the 5.0 format which resulted in build errors. This has now been fixed.

3201516 (1117855)

- The COBOL editor could show incorrect error messages for linked resources with file-specific COBOL settings. This was due to the file settings being ignored.

3197950 (640058)

- Editing in Block Selection mode with Smart Edit enabled now works correctly in the COBOL sequence area.

3195496 (1117297)

- Debugging COBOL programs with Eclipse might be slow when large numbers of breakpoints are specified.

3195046 (1117630)

- Incremental linking will no longer attempt to relink object files which have the same timestamp as the resulting executable output. This prevents an issue where filesystems with less granular timestamps could cause unnecessary relinking when the linking process had previously completed within a second.

3188828 (1116800)

- When a Build Environment script is specified in a project, any copybook paths specified on the project Build Path are now included in COBCPY when building.

3164533 (1117034)

- Server Explorer could not export to a location that contained spaces in the path. This has been fixed.

3164533 (1117924)

- Exporting a region for the second time to the same location now works correctly.

3164533 (1117925)

- When COBOL source files were included in sub-folders of the project, the analysis was failing because the data was not being generated in the correct location. This has now been fixed.

3161441 (1114519)

- Additional directives from Project, Build Configuration, Folder, and File setting levels are now correctly appended when performing a background parse.
- Trying to start a remote PL/I application debug session used to fail for connections of the type "Micro Focus DevHub using SSH".
- Duplicate lines are no longer added to the eclipse.ini file when a Patch Update is installed.

Interface Mapping Toolkit

[Back to the list](#)

- A problem that caused an erroneous JSON response to be generated when an empty array was present has been fixed.

3217017 (1119563)

- You could receive an intermittent failure if your code has interfaces that contain multiple parameters that each map to linkage items containing COBOL tables defined with the OCCURS DEPENDING ON clause. This could occur due to referencing of freed memory.

3179075 (1116037)

- XML parsing has been enhanced to correct an error that occurred when generating a SOAP Web service that uses the word "zero" to represent the numeric value '0'.

3209106 (1118548)

- Remote external paths (specifically, things included on \$COBCPY) are now correctly calculated when generating a web service or Java interface from a remote project.
- Enterprise Server now supports JSBIND files greater than 1MB in size.

3208935 (1118688)

- When using Web Services, a COBOL service with a parameter containing nested OCCURS DEPENDING ON tables no longer crashes if one of the nested tables is of a primitive data type.

3204381 (1118234)

- When sending a request to a CICS Web Service, data for all "FILLER" group items within the same COBOL group are now correctly returned.

3221568 (1119656)

- A problem that caused a CASPI1009E error-OUTPUT_OVERFLOW to occur when a SOAP message was sent for channel-based SOAP services having string data greater than 64K has been corrected.

3209490 (1118583)

- You no longer receive a message "Directive -C invalid or not allowed here" when running ls2ws under UNIX or Linux.

3209071 (1118509)

IBM Language Environment for OS/390 & VM Support

[Back to the list](#)

- An error in calculating the start of the LE century window has been fixed.

IMS Support

[Back to the list](#)

- When importing an IMS Data View, a PCB statement in the specified PSBSRC file was being incorrectly analyzed, causing the Data View Import to fail. A fix has been put into place to correct this issue.
- On UNIX platforms, a fast sequence of checkpoint calls could occasionally result in an RTS 173 on program Sleep.

3225576 (1120036)

- The error code of a field search argument (FSA) is now returned to a FLD call.

3220405 (1119523)

- When using the AIBTDLI interface, a GET call followed by a CHKP returned a U100 ABEND. This has been fixed.

3212284 (1118798)

- A partially successful GN call with multiple SSAs and some with Boolean logic could return an incorrect segment level in the PCB key feedback area. This was introduced with the fix for SI 3138482 (RPI 1112600). The proper database position after the unsuccessful call was not affected.

3203792 (1118045)

- IMSTRACE is now produced when the enterprise server instance is configured as EBCDIC.

3202491 (1117917)

- User DB Exits are now supported for GSAM databases.

3200366 (1117812)

- IMS marks a JES container as dirty if an IMS application abends or is aborted. To disable this behavior, set the following environment variable: ES_IMS_JES_DIRTY_ABEND=N.
3193636 (1117252)
- An OPEN of a secondary index DB did not automatically retry if the file was held exclusively by another job, resulting in a 9/065 open error. This has been fixed.
3192082 (1117021)
- A problem that restricted the /START DB command when a PROCOPT=GO PSB was active has been corrected.
3160070 (1117397)
- An RTS114 error sometimes occurred when an IMS DB with no defined segments larger than 250 bytes was used, and the localdli feature was enabled. This was due to a buffer overrun, and has now been corrected.
3155265 (1114287)
- Update-intent locks were incorrectly issued in IRLM for PROCOPT=G PCBs. This created unnecessary lock constraint.
- The size of the output control buffers generated by MFS has been increased to be compliant with the maximum size of 32K.
3225323 (1119988)
- The buffer size to handle controls and literals for large MFS source files has been increased.
3222665 (1119742)
- IMS images now provide additional sign-on screens for UNIX/Linux images in the same way as these are present on Windows.
3197558 (1117485)
- The MFS generator now handles FILL=NULL correctly for EBCDIC and EGCS control blocks. MFS code of the form shown below now sets the null compression bit in MID and MOD headers correctly in MFS files compiled with CBEBCDIC and CBEGCS options: MSG
TYPE=INPUT,SOR=(DV0670),NXT=MODV0670 LPAGE SOR = (DPAGE1) SEG MFLD
PFKFLD,LTH=22,FILL=NULL MFLD 'TRNV0670 ',LTH=9
2822469 (1099666)
- In a situation where the AIBTDLI API call for a database retrieval also requests an IO area length which is less than the actual length returned, you no longer receive an U100 abend. Instead, control is given back to the application and you can check the AIB return and reason codes.
3223544 (1119857)
- BMP applications can now use the SSM specification in the DFSRRC00 PARM= to select the preferred resource manager when multiple XA resource managers are defined.
3222338 (1119740)
- An incorrect destination was used when a BMP issued multiple messages from a modifiable alternate PCB. This issues was introduced with the fix for RPI 1117611.
3221948 (1119657)
- When an IMS86ENT system exit is installed, the initialization (INIT) function was issued before the application environment was established. This caused problems for Assembler debugging and with AMODE pointer formats in MVS control blocks. This has been corrected by delaying the INIT function until the application environment is established. As a result of this change, support for version 1 of the IMS86ENT interface has been dropped, and support for specifying the old PCB list format has been dropped for version 2. This is a concern only for IMS86ENT modules that are more than 20 years old as of this release.
3204941 (1118157)
- Swedish characters in MFSGEN, PSBGEN and DBDGEN error messages were displayed incorrectly. This has been fixed.

3204665 (1118780)

- The following IMS commands are now supported: /START TRAN ALL, /DISPLAY Q TRAN, and /DISPLAY STATUS TRAN.

3201229 (1117798)

- Inbound queue BMPs are now fully supported.

3198857 (1117611)

- SSTM JCL for IMS and CICS did not support the WIDTH() and NOHEX parameters. This has been fixed as follows: WIDTH=<n> - Sets the width of the line in the trace file to the value of <n>, where <n> is an integer from a minimum of 50 to a maximum of 110. NOHEX - Suppresses the display of hex values in the trace. Example: //BTSCONFG DD * PCB SSA IOAREA STATS TIMES LISTFILE WIDTH=80 NOHEX /*

3192316 (1117081)

- Please add this RPI number and supportline number to the readme entry for RPI with 1118157.

3188517 (1116731)

- Two new options of BTSCONFG, CONSOLE and JESLOG, enable you to direct the BTS trace output to the Enterprise Server console and to the job log, respectively.
- For IMS Connect requests for conversational transactions, the transaction code is no longer prepended to the message.

3220261 (1119536)

- A PURG call from a PL/I application without an IO area (parm count 2), could cause a memory fault.

3220120 (1119495)

- The default behavior of IMS Connect is to set LTERM (if not explicitly overridden) to the port-ID when commit-mode is one. It is now possible to override this behavior by setting the environment variable ES_IMS_CLIENTID_LTERM=Y to the server's configuration information. In this case LTERM would be set to the client-ID instead of the port-ID.

3216740 (1119263)

- ES IMS TM WFI (Wait For Input) MPPs (Message Processing Programs) now honor the configured processing limit specification. They now also receive a QC when commanded to stop or when Enterprise Server enters shutdown phase one processing. ES IMS TM HSF (Historical Statistics Facility) now correctly report the processing time, schedule latency, user ID and LU (Logical Unit) for transactions that are processed by an MPP after the initial transaction. ES IMS TM now allows an MPP's post QC logic to execute during phase one of Enterprise Server shutdown.

3215544 (1119080)

- A problem that caused the LTERM name of the initial connection to be changed upon user sign-on when the enterprise server region configuration specified the ES_IMS_LU_LTERM=Y environment variable has been fixed.

3210531 (1118642)

- Issuing a /DISP USER command for a stopped user no longer results in an RTS 114 error.

3210356 (1118662)

- For IMS Connect requests, the default LTERM name is now correctly set to the Client ID when the IRM commit-mode is zero. When the commit-mode is one, the default LTERM name continues to be set to the port number.

3206345 (1118494)

- Issuing an IMS command with missing parameters at a 3270 terminal no longer results in an RTS200 error.

3199381 (1117788)

- A problem that sometimes caused an RTS200 error has been fixed.

3188009 (1117134)

- The mfims utility was looping where parsing a stage 1 extract file, when the file had a parameter in the form of "keyword=," . This has been fixed.
3224785 (1119939)
- In order to successfully use the Drag And Drop utility to load local IMS databases, you must set the environment variable ES_ACBLIB to the location of the generated ACBs. If this variable is not set, then the variable ES_IMSLIB will be checked for ACBs. Other locations defined by environment variables such as ES_IMSLIB2, ES_IMSLIB3, etc. will not be checked. Additionally, if an invalid directory (such as one that does not exist), the search terminates. Any directories assigned to the IMS variables must be valid.
3217859 (1119302)
- A problem that prevented the UNLOAD and LOAD functions of the IMS database utility (IMSDBU) from removing orphan segments in the database or unload file has been resolved.
3216293 (1119535)
- The IMS stage-1 extract utility no longer hangs when sublists span multiple lines.
3197178 (1118104)
- The following corrections have been made to the Stage-1 extract: - APPLCTN macros that start with RESIDENT or DOPT are now accepted - APPLCTN macro, PGMTYPE= parameters defined with unnecessary parentheses are now accepted. For example: PGMTYPE=(TP) PGMTYPE=(BATCH) - APPLCTN macro, PGMTYPE= parameter class code definition is now used when subsequent TRANSACT macros do not define a class code in the MSGTYPE parameter - The limit on TRANSACT macros per APPLCTN macro have been removed
3168373 (1115085)
- An arithmetic error sometimes occurred when using IMSDBU to operate on an empty IMS database. This has been fixed.
2812019 (1098275)

JCL Support

[Back to the list](#)

- When creating a new PDSM file with multiple possible extensions, the JCL engine may have selected the last extension in the list and not the first. This has been fixed.
3222743 (1119745)
- An issue with REPRO processing that prevented concatenated input to be written to the output when the first dataset was empty has been resolved.
3222490 (1119723)
- Certain performance improvements have been made for REPRO operations when using database-hosted data sets.
3221949 (1119824)
- The splregr utility no longer reports a duplicate record error when writing to the casspool file.
3220666 (1119547)
- An issue with opening the spool control files when they are database hosted has been resolved.
3220461 (1119528)
- A used symbol is no longer incorrectly identified as unused, when the same symbol name is used and the value is changed in subsequent steps.
3219129 (1119411)
- Existing records in a target file of a IDCAMS REPRO command are now removed correctly even when the source file has no records to be copied.
3219021 (1119401)

- An error that resulted in the incorrect JCL symbol being used in a job with a SET symbol name and an EXEC procedure with a parameter of the same symbol name has been corrected. The overriding EXEC PROC parameter is now used correctly.
3218403 (1119384)
- A compiler error in the sample spool API programs, SPOOLCOB.cbl and SPOOLPLI.pli, caused by an incorrect field name, has been corrected.
3215587 (1119090)
- An error in the Catalog Maintenance Utility (MFCATMNT), which prevented multiple data sets from being removed, has been corrected.
3215585 (1119135)
- The size of the delimitator for in-stream data (such as DLM=AAAA) has been increased to eight characters for JES2 JCL jobs. The size is limited to two characters for JES3 JCL jobs.
3214287 (1119085)
- An issue has been resolved that was stopping FTP 'put' processing for a PO file that followed an FTP 'put' process for a GDG generation.
3214157 (1118956)
- An error when using LISTDS with data set names that consist of more than 6 nodes has been corrected. (The maximum number of nodes in a data set name is 22.)
3210286 (1118599)
- The %PCDSN extension can be used to set the location of a GDG when you define it with IDCAMS.
3210206 (1118679)
- It is now possible to use static system symbols defined in SYS1.PARMLIB(IEASYM00) in JCL jobs.
3207122 (1119387)
- The file status on return from a catalog delete action was occasionally incorrect, giving a value of 23 - not found.
3206007 (1118318)
- The JCL engine has been updated so that JCL OUTPUT statements support the following: AFPSTATS, AFPPARMS, MAILBCC, MAILCC, MAILFROM, MAILTO, REPLYTO, USERPATH.
3205480 (1118229)
- The processing of symbol values within nested procedures now returns the correct value for the nested level.
3205074 (1118149)
- The spool CREATE-DATE and CREATE-TIME passed to the printer exit now contain the correct values.
3205024 (1118170)
- You can now adjust the value of MF_UCC11 used for a job by using the MFJUXIT user exit.
3203148 (1118043)
- You no longer receive an error message when running the Batch TSO command processor from a PL/I program.
3201691 (1117858)
- A problem that resulted in an INTRDR data set not being submitted to the Internal Reader following the submission of an empty data set has been corrected. The submission of an empty INTRDR data set will now cause a new physical file to be allocated to the DD for the next use. The empty data set will be left on disk.
3198143 (1117676)
- An issue in MFJPTPCH which caused sysout datasets to remain 'ACTIVE' after the step had completed has been fixed.
3196948 (1117448)

- A change to the dataset disposition processing introduced in ED 4.0 PU9 that stopped catalog entries being updated has been corrected.
3194787 (1117229)
- An issue that caused the ELSE and ENDIF lines of a job-stream to be missing from the job log has been resolved.
3193418 (1117114)
- A SYSPRINT message has been added, which indicates that a GDG file has been altered by IDCAMS.
3187283 (1116862)
- The user exit mfjfaxit.cbl can now be used to receive notification of JCL 'file open' events.
3181759 (1116185)
- The user id and password now support spaces as well as forward slash symbols (/) as separators.
3179919 (1116060)
- A memory error could occur in mvscatio when checking for a possible separate idx file.
(642712)
- MVSSPLHK incorrectly reported a JCLUT0110U error with seven digit regions and no INDEXO definition in the job step.
- The number of executable statements which exceed the 255 limit is now reported correctly.
3216719 (1119261)
- A failure when renaming the separate data set index file when performing an IDCAMS ALTER command has been corrected.
3213354 (1119063)
- The validation of the USER or UINF field in a VSE POWER LST statement has been corrected.
3198561 (1117575)
- It is now possible to assign 'SYSIN' as a Logical Unit id in the VSE configuration file. It must have a corresponding device id, and the device type must be 'READER'. 'SYSIN' can be used when assigning an in-stream input dataset.
3196337 (1117434)
- Parsing errors for JSEP option and DEST user id on PWR LST statements have been corrected and the parameters are now passed to the printer exit. The limitation on the BUFSP value has been increased in line with the mainframe value.
3195118 (1117292)

Licensing

[Back to the list](#)

- Windows Server 2016 machines might need to be restarted regularly because of a large number of open handles on the mfcesd (Micro Focus Compliance Enforcement daemon) process. The open handles are now freed correctly and will no longer accumulate.
3213000 (1118881)
- The product Help now includes instructions for how to manually enable an Automatic Restart of the SafeNet License Daemons on Linux using SystemD.
3210607 (1118628)
- During installation, the directory structure of /var/microfocuslicensing will now have the correct and secure permissions set.
3179691 (1116046)
- An application being deployed using the CESDYNAMIC option of a Runtime Launch Configuration file now succeeds in getting a licence when executed for a second time.

3160922 (1114454)

Micro Focus Common Client

[Back to the list](#)

- Memory-access errors no longer occur in MFCC (mclient.dll/ cobmclient.so/libmclient.so) when certain malformed messages are received from the server. MFCC now detects these conditions and logs an error message.
3213653 (1119419)
- cassub and other Enterprise Server utilities now support host names of up to 255 characters long.
3196153 (1119249)
- The IMTK service-deployment function can now read credentials for secured deployment services from the MFCC configuration file mf-client.dat.

Micro Focus Directory Server

[Back to the list](#)

- MFDS CA server root certificate and TLS client options are now available via the ESCWA UI.
3218442 (1119593)
- The Shared Memory Cushion entry field in the Enterprise Server Administration UI now accepts five digits.
3210200 (1118594)
- If external security is configured for the Micro Focus Directory Server (MFDS), then a user attempting to import region configuration using the "mfds -g" command now requires "Add" and "Delete" permissions for the "Repository Access" resource under the "Enterprise Server Administration" resource class.
3209555 (1118581)
- The mfds -g command line waits to time out rather than receiving an immediate fail as a result of an import error.
3209555 (1118572)
- In some circumstances, the Micro Focus Directory security settings were not being saved. This has been fixed.
3209389 (1118705)
- If the MFDS process is not TLS-enabled, setting the MF_ROOT_CERT environment variable could cause region startup to fail. This has now been fixed.
3205462 (1118274)
- The Micro Focus Directory Server KEEPALIVE and some other connections to a TLS-enabled Communications Process Control Channel listener were failing to connect. This was because they were using the IP address rather than the hostname which the certificate requires.
3204824 (1118193)
- If the MFDS -o option is used to override the options file location, option changes were not successfully saved. Use the same location when saving option changes, and this problem does not occur.
3171825 (1115391)
- ESDEMO64 is now in the standard MF Directory Server startup repository together with ESDEMO. If the MSSIVP repository is imported it contains MSSDEM64 together with MSSDEMO.
3168860 (1115116)
- On UNIX, if the MFDS "Default process user ID" value is set, from either the GUI or with the "mfds -f" command line option, before the MFDS process starts, it will change its effective uid to the specified value after it has started listening on its configured endpoint. This enables the MFDS process to run using a non-root uid while still using the default privileged port 86. If the uid specified is invalid, the MFDS process terminates.

3122797 (1119862)

- If the environment variable MFDS_DNS_RESOLVE=Y is set, then the Enterprise Server Administration web interface's HTTP response headers will not return the MF Directory Server IP address in HTTP cookie values.

2863212 (1104835)

- Previously, changes made to the listener configuration in the Enterprise Server Administration Web UI were not becoming active for a started region.
- The MF Directory Server process could abnormally terminate if the listener description text input via the Enterprise Server Administration Web GUI was greater than 64 characters in length.
- A number of XSS vulnerabilities in the Enterprise Server Administration have been resolved.
- Under some circumstances, it was possible to set MFDS restricted access with improper credentials checks.
- Any region auto-start credentials and XRM open string values are now stored in the MF secrets vault facility if the Micro Focus Directory Server is configured to use it.
- When the Micro Focus Directory Server is running in a container, the region status is set to started only when all expected listeners are started.
- The mfd -l schema export command-line option now supports the OpenLDAP OLC (on-line processing) LDIF file format (use option 4).
- When adding a listener using the Enterprise Server Administration Web UI, the initial listener state was incorrectly set to "Invalid".
- In the Enterprise Server Administration Web UI, the service namespace values of the deployed REST services were incorrectly displayed.
- MFDAS XML import can now import more than one comms process.
- The ESCWA API would reject adding a listener to a region if there was already a listener with the same requested fixed port value defined in the target MFDS.

MF Server Administrator (GUI)

[Back to the list](#)

- There is no longer an issue with using the mfd -g option to import an XML region definition with services that reference listeners.

3219549 (1119459)

Mainframe Access

[Back to the list](#)

- MFA Client now rounds any mainframe time difference to the nearest time zone block where a block consists of 30 minutes.

3223202 (1119813)

- MFDAS secchk is now handling negative time differences correctly.

3223202 (1120059)

- MFAWrapper findmem can now scan for up to 803 members.

3219388 (1119426)

- MFDAS Findmem now supports copybooks with embedded binaries.

3218396 (1119388)

- MFDAS no longer restricts /CATOVERRIDE to a subfolder of the catalog location.

3213304 (1118931)

- Missing CGMQ application servers on MFA Sever configuration migration are now handled correctly.

3199393 (1117660)

- Zero length files no longer result in a hang on MFDAS VSAM import.
3194976 (1117273)
- Dataset names are now folded to upper case on catalog import.
- When using the USS Explorer view to list files and directories of a path that contains a symbolic link to a non-existent file, truncation of returned data would occur.
- TAUTOXCC REXX has been updated to enable it to allocate and deallocate the required SYSDMDECK and any additional SYSUTnn datasets. It also marks the point where the COBOL 6.3 library (IGY.V6R3M0.SIGYCOMP on CSIMVS) is selected over the current 4.1 library (IGY.V4R2M0.SIGYCOMP).
3220259 (1119637)
- New parameters TSO_NOTIFY and TSO_MSGCLASS have been added so that TSO session tasks have NOTIFY and MSGCLASS specified on their job cards.
3218215 (1119435)
- The parameter TSO_JOBCHAR_PREFIX has been provided to specify that the job char should be prefixed to the job name.
3214413 (1118992)
- Messages MFM0014I/12I/13I are now emitted again if XML parameter files are being used. Previously, these were emitted by the old-style parsing routines.
3210348 (1118602)
- MFA creates dependent ASIDs using the reusable ASID attribute because they use cross-memory services. If this does not happen, ASIDs might become depleted which results in the following message: "IEA061E REPLACEMENT ASID SHORTAGE HAS BEEN DETECTED" However, due to deficiencies in DB2, if it is invoked from a reusable ASID, it abends with 0D3. A new MFA configuration parameter, REUSE_ASID="0", has been provided so that you can start MFA-dependent ASIDs as non-reusable. If message IEA061E is received, all MFA ASIDs will be shut down to mitigate the shortage.
3208212 (1118422)
- MFAAS tasks will now be shut down if inactive for a certain period in all circumstances.
3206480 (1118407)
- A new configuration parameter, COMPRESSION_TYPE, with values "0" or "1" has been added to MFA. When COMPRESSION_TYPE="1", the client can negotiate to turn off data compression, which could dramatically improve performance when transferring binary files.
3205825 (1118218)
- An attempt to catalog a data set with an invalid recfm/blksize/lrecl combination results in an error message being displayed.
3205761 (1118228)
- The CEE libraries have been removed from MFAAS STEPLIB. This is because they are not needed and could cause issues if they are not in the APF list.
3205421 (1118189)
- The version of HLQ.MFA.EXEC(TAUZCAPP) shipped with the product contained an incorrect default location for the SYSDSN variable.
3202754 (1118103)
- The version of HLQ.MFA.CNTL(MFATSO) shipped with the product contained incorrect default values.
3202754 (1118088)
- MFA will no longer cause data sets on tapes to get an allocation failure 0218/0000 when the tape needs to be mounted.
3197647 (1117758)
- You can now use MFDAS to download keyword Endeavor members.
3185781 (1116540)

- A new parameter `CONSOLE_NAME` has been provided so the actual console used to execute JES commands on behalf of a user may be specified. By default, the master console is used.
3185156 (1117142)
- MFDAS Rename of datasets now returns the correct return code.
- VSAM PRO files no longer receive incorrect minimum LRECL values from MFA downloads.
3209412 (1118578)
- Catalog processing has been updated to deal with unexpected output from IGGCSI00. You must be using at least MFA V7.0 to take advantage of this update.
3190132 (1116977)

Micro Focus Batch Scheduler Integration

[Back to the list](#)

- Support has been added for secured Redis when using MFBSI in a PAC.
3225748 (1120060)
- Control-M variables starting with a # character were not handled correctly.
3222729 (1119761)
- Under some circumstances, `mfbsijcl` would not stop executing and would not return RC208 to the scheduler.
3219288 (1119462)
- On 64-bit AIX machines, internal MFBSI time stamps were incorrect.
3205581 (1119053)
- The sample in the topic "JCL Parameter Substitution" has been clarified to show the need for an extra period in the MFBSI basic substitution.
3203025 (1117969)
- Support has been added for the Control-M function `%%$WCALC` which requires one or more Control-M Calendar definitions. See your product Help for details about how to create Control-M Calendars.
3191119 (1116965)

Micro Focus Unit Testing Framework

[Back to the list](#)

- We recommend that you rebuild your unit test shared objects, or dynamic link libraries, or any file that includes `mfunit.cpy`, as a change in the contents of this copybook might result in a run-time error.
3222692 (1119866)
- Micro Focus Unit tests with data driven tests that use CSV have had some size limit increases.
3214717 (1119038)

PL/I Support

[Back to the list](#)

- Register allocation algorithm has been improved to fix some cases where `SELECT_REG` was unable to select a register.
3219161 (1119418)
- Using -prefix options will no longer cause parameter corruption on calls to array entry variables.
3207573 (1118576)

- MFPLI now embeds compiler version information string in the .data section of each object file or library. It starts with a special character i.e. @(#) so that it could be searched easily.
3220567 (1119545)
- The Open PL/I diagnostic message MFPLI01227W pertaining to passing arguments BYVALUE has been relocated from the call point to the declaration of the entry, and modified appropriately.
3220424 (1119648)
- A problem with the LEFT, RIGHT, CENTERLEFT, and CENTERRIGHT built-ins accepting a fixed binary data item as the first argument has been fixed.
3216779 (1119208)
- An optimization has been put into the symbol handling routines to increase the speed of the compiler.
3215758 (1119110)
- A problem with an EXEC SQL statement split across %INCLUDE files has been corrected.
3214324 (1118985)
- The NOINIT attribute will not be inherited anymore if a variable is declared LIKE another structure variable.
3207149 (1118360)
- A compiler problem related to using the options -zalign -nolaxbased has been resolved.
3206200 (1118259)
- You now receive a warning message when executing a PL/I program that has a SELECT statement which does not contain any WHEN or OTHERWISE clauses.
3196179 (1117356)
- Executing PL/I code no longer generates an error condition if a SELECT statement is empty.
3196179 (1117357)
- Setting up an ON unit which utilizes an uninitialized FILE VARIABLE could result in a trap at execution time when the ON unit was established.
3196179 (1117364)
- The Open PL/I compiler now diagnoses an unqualified name resolved to a structure member rather than a matching non-member declaration of the same name in a parent block with an Informational (I-level) diagnostic (MFPLI01305I).
3190928 (1116926)
- A compiler issue with the -rc 4,0 option has been fixed.
3184621 (1116421)
- The -bifprec {15|31} option that sets the precision of a built-in function's result to 15 or 31 is now supported.
3182406 (1116280)
- A problem with diagnostic message file and line numbering when a declare statement is split across %include files has been fixed.
3179779 (1116068)
- XREF tables in the compiler listings now include extra details such as entry parameter descriptors, options and return type.
3179057 (1116109)
- The problem related to default range statement in a particular scenario involving based storage class has been fixed.
3178279 (1115951)
- The behavior of default range has been modified to support the following syntax: DEFAULT RANGE(IDENTIFIER:IDENTIFIER)
3178219 (1115941)

- A problem related to array cross-sections when specified in STRING BIF or pseudo-variable, has been fixed.
3178027 (1115916)
- The behavior of assignment to limited entry has been fixed.
3176698 (1115817)
- A problem when using LIKE attribute on a structure with any member having repetitive initializers via (*) has been fixed.
3174555 (1115628)
- Using string pseudo-variable sometimes incorrectly ends up in severe error MFPLI00164S (Invalid conversion required by an assignment or RETURN statement). This has now been fixed.
3163727 (1114733)
- The TRIM built-in is now supported when applied to structures.
3163164 (1114710)
- The LEFT built-in is now supported on arrays. In addition, the RIGHT, CENTERLEFTT, and CENTERRIGHT built-ins are also supported on arrays. Restriction: Arrays of structure or structures containing arrays are not yet supported.
3163163 (1114709)
- All information is covered in RPI 1113159 (combined).
3140468 (1113161)
- Open PL/I now supports the FIXEDBIN and FIXEDDEC built-ins. In addition, the FLOATBIN and FLOATDEC built-ins are also supported. Restriction - array arguments are not yet supported.
3140466 (1113159)
- The VALID built-in function now supports fixed decimal arguments.
3139150 (1112862)
- The COPY option in GET statements is now supported.
3139143 (1112841)
- The Open PL/I compiler now supports the GENERIC attribute.
3139122 (1112605)
- The Open PL/I Compiler and run-time now provide support for the built-in functions FILEREAD, FILEWRITE, FILETELL and FILESEEK when used with files of RECFM=U or ENV(U).
3137457 (1112594)
- A problem causing the SQL preprocessor to abort has been fixed.
3118614 (1110627)
- The ENV attributes RECSIZE, KEYLOC and KEYLEN can now have argument of type static fixed bin(31).
2857789 (1104097)
- A problem related to the use of -debug option and extremely large decimal values in %REPLACE statements has been fixed.
- During evaluation, the depth of a structure's child was miscalculated when the pointer it was being dereferenced from was also part of a structure (i.e. a.b -> c.d, the depth of d was miscalculated). This has now been fixed.
3215015 (1119032)
- Variables with a # and/or @ in the name can now be evaluated in the CodeWatch debugger for PL/I.
3214780 (1119013)
- The way parameters were passed through cw_java to the program to be debugged was compressing spaces in string arguments that were enclosed in quotes. That has now been fixed.

3209251 (1118587)

- Enhancements have been made to the debugger to support figuring out the next debuggable statement which will be executed when the user steps off the end of a PL/I On Unit. This allows the debugger to set a temporary breakpoint so the user can continue stepping through the user program upon return rather than execution "running" to the next user breakpoint. Stepping through a PL/I GOTO statement from an On Unit is supported as well.

2674783 (1095097)

- Support for the old ioctl-based version of the /proc interface is no longer available by Oracle, so it had to be replaced with the new structured /proc interface.
- If your project was missing some DC files, the debugger would still call the DC API when searching for an include file id.

(638064)

- An issue where variable editing in hex mode in Eclipse was ignored has been fixed and now variables can be edited correctly using hex mode editing.
- Frames were being handled through COBOL, and failing because of a change on the COBOL side. This has been fixed by now handling frames through PL/I.
- A problem where character varying variables could not be edited in the expressions view when debugging has now been fixed.
- Related expression objects were being handled through COBOL, and failing because of a change on the COBOL side. This has been fixed by now handling related expressions through PL/I.
- A problem where the user was stopped outside of user code after hitting suspend has been fixed.
- When trying to debug a program that references or exports main, the debugger no longer hangs. Instead it shuts down and the actual issue of not being able to debug it still persists.
- The issue where CodeWatch couldn't attach to a running process on Solaris has been fixed.
- The problem where bit variable values could not be changed when debugging has been fixed.
- The XMLDEMO example as shipped failed on the call to the PLISAXA API because the events structure passed to it was not using the required data type of ENTRY LIMITED. The examples have been updated to match the XML support.

3191102 (1116960)

- Text strings that spanned more than two lines with margins in effect, after the first line they were not treated as literals and were split incorrectly. Now, text strings that reach the right margin, are split (right margin), with the next line starting at the left margin.

3220169 (1119510)

- Previously, if your macro attempted to build a literal string larger than 16392 bytes, it would cause an error condition. The macro preprocessor now supports literal strings up to 32767 bytes.

3213596 (1118910)

- Previously, if a macro DO statement contained an expression which used a parameter that had the same name as an element of the DO statement, it would fail with improperly formatted statement message. This no longer occurs.

3213286 (1118886)

- Previously, when invoking a macro using ANS() that spanned several lines of source code, the error messages generated for the following lines were not correct.

3198979 (1117618)

- When margins were in effect, comments were split on margins, resulting in debugging generated information (-tagdbg) also being split. They are now treated as regular statements.
- Previously, any character greater than 0x7f passed to the PLISAXA parser was not being handled correctly. It now correctly handles all characters from 0x00-0xff.

3218472 (1119393)

- Previously, if driving XML through PLISAXA that exceeded 32768 bytes in length on some Linux/UNIX platforms, it caused not all of the events to be driven. This no longer occurs.
3217941 (1119310)
- When executing a PL/I DISPLAY() REPLY(); statement, a failure to fetch MFPLIACPT64 was occurring. This no longer happens.
3217138 (1119240)
- The performance of the automatic conversion of FIXED DEC values to FIXED BIN values has been optimized to remove the excess calls to sigprocmask.
3216747 (1119209)
- mfpli performance has been improved to reduce compile time for many programs.
3215758 (1119429)
- Previously, if the CBL_ERROR_PROC API was not already present in the DB2 process which was executing stored procedures, then a PL/I program would fail at initialization with an ERROR while attempting to FETCH the entry point. This no longer happens. This was a side effect of the change for RPI 1115804.
3212453 (1118937)
- A SIGSEGV exception would occur on the OPEN statement of a PL/I file in the second or subsequent execution of a PL/I jobstep that utilizes DSNRLI.
3194910 (1117529)
- An issue that occurred when an UNDEFINEDFILE condition was raised against a DD that attempted to read a non-existent PDS Member no longer results in a memory corruption.
3194856 (1117372)
- Previously, if you tried to invoke PLISAXB from a JCL-based program utilizing instream data, and the temporary instream dataset was in a long and spacey directory, the call to PLISAXB would fail. This no longer occurs.
3191102 (1118048)
- Heap information is now available in PLIDUMP output.
3150586 (1113742)
- An issue with dynamically turning on CTF traces when a program runs under the control of a JCL-enabled enterprise server has been resolved.
- The incorrectly produced error message "Severe MPLIE00099S : Internal system error "SYM08-RC -0000000008 from dsym.". Contact Micro Focus Support." will no longer be produced. This internal system error has been fixed.
3208678 (1118470)
- The size of a statement the SQL preprocessor (execpp) can handle is now twice as big as before.
3201949 (1117888)
- Comments immediately adjacent to other language elements (including those reported in the RPI) are now handled correctly.
3201845 (1117873)
- A problem causing the SQL preprocessor to abort has been fixed.
3188874 (1116775)
- A problem processing multiple EXEC statements occurring at the outermost level of a source program has been fixed.
3169777 (1115316)

REXX Support

[Back to the list](#)

- Closing braces near the end of a line in SYSTSPRT no longer cause a hang.
3216030 (1119170)

Run-Time System

[Back to the list](#)

- The NUMVAL intrinsic function no longer produces an error at run time when used with national data in a program compiled with a mainframe COBOL dialect.
3191506 (1117099)
- The CBL_GET_EXIT_INFO library routine has been further enhanced to detect the circumstances in which an exit procedure has been invoked. It can now better distinguish between normal and abnormal terminations.
- In .NET and JVM COBOL code, under numproc(acos), some instances of illegal data in a USAGE DISPLAY field did not produce an RT163 error when should have.
3215249 (1119051)
- .NET and JVM COBOL only. An issue has been resolved in arithmetic statements where the target item is a binary item 9 bytes or larger (19 decimal digits or larger) and the result has magnitude which is greater than or equal to 2^{64} .
- A statement of the form "compute item rounded = expression" where expression includes at least 1 comp-1 or comp-2 item sometimes gave the wrong result because it did not perform the rounding. This has been fixed.
3224247 (1119910)

Setup

[Back to the list](#)

- When installing on UNIX, the MFDS and SSL configuration files are stored under /opt/microfocus/config and symbolically linked back to the installation location. When Patch Updates are installed to the same location, the configuration is now preserved.
3212913 (1118927)

SQL: COBSQL

[Back to the list](#)

- COBSQL now supports EBCDIC conversion for FETCH statements with more than ten host variables.
3225338 (1120132)
- Informix now handles cases in which comments were included inside EXEC SQL statements or variable declarations were broken into two lines inside EXEC SQL statements.
3220792 (1119585)
- OpenESQL now correctly handles calling Stored Procedures with output host variables which use the dynamic SQL method.
3212664 (1118834)
- A problem that prevented COBSQL from reporting errors to the checker when the precompiler file was missing has been fixed.
2867407 (1105864)

SQL: HCO for DB2 LUW

[Back to the list](#)

- An issue with ODBC and DB2 ECM generated code not having uniquely named sections has been resolved.
3224210 (1119896)
- XML data is now correctly sent to the DB2 server.
3220909 (1119685)
- DB2 ECM now handles the CLOB value in EBCDIC correctly when DIALECT(ENTCOBOL) is specified.
3217813 (1119335)
- There is no longer a problem compiling programs with host variable arrays if they are used with the SELECT INTO statement. A problem with the output host variable array processing where array HVs or a mix of array and individual HVs were being processed incorrectly has been fixed.
3216314 (1119188)
- The MFHCO tool now takes login credentials from the command line for remote database access without asking for user inputs through a pop-up window.
3212431 (1118968)
- A ddl command which contains a number of characters greater than 32K could cause a hang condition in the HCO for DB2 LUW ddl generation tooling.
3205207 (1118168)
- The DB2 ECM was incorrectly handling floating point conversion when runtime option MAINFRAME_FLOATING_POINT was enabled. This has been fixed.
3198121 (1117644)
- DB2 ECM now supports multi-row FETCH/INSERT/UPDATE, which includes but is not limited to the usage of the FOR nn ROWS clause.
3155753 (1114251)

SQL: HCO for SQL Server

[Back to the list](#)

- An issue where HCOSS would not translate the format for DB2 z/OS TIMESTAMP (or TIME) default values to SQL Server format has been resolved.
3192321 (1117110)
- A problem loading date values of mixed formats of ISO and EUR using SQLUTB when the Input Date format was configured to EUR has been fixed. In addition, a problem with the EUR date format incorrectly processing multiple formats of Date values mixed in the same dataset has been fixed.
3217501 (1119290)
- HCOSS now handles the CHAR() function correctly.
3207701 (1118380)

SQL: Mainframe Batch Database Tools

[Back to the list](#)

- When starting the MBDT/ESQL Configuration UI, the registry key entries are now processed correctly.
3227324 (1120217)
- There is no longer an issue with unloading NULL values from DECIMAL fields using SQLUTB if the enterprise server region is running in ASCII mode. An issue with the data overflow which occurred during decimal data conversion where NULL values were being processed incorrectly has been resolved in SQLUTB.
3223817 (1119860)

- There is no longer an issue with submitting and executing jobs after canceling a SQLUTB job. An issue with a duplicate connection name which resulted from a SQLUTB job cancellation where the ODBC connection was being handled incorrectly has been resolved.
3219445 (1119442)
- There is no longer an issue with counting the number of records loaded into the table if the data set contains duplicated records. An issue with the loaded record counting where multiple counters were being processed incorrectly has been resolved.
3218617 (1119413)
- There is no longer a problem making XA connection if only the XA ID is given in the SQLUTB utility parameters. A problem with the SQLUTB utility parameters parsing where the XA ID in the absence of utility id was being processed incorrectly has been fixed.
3214354 (1118975)
- There is no longer an issue with emulating the Fujitsu mainframe feature of checking LRECL of SYSREC against the row size if "Check LRECL" is enabled in the MBDT Configuration Tool. An issue with the SQLUTB LOAD processing where LRECL of SYSREC being greater than the row size was processed incorrectly has been resolved.
3210919 (1118703)
- SQLUTB now supports multi-tables load.
3207120 (1118344)
- An issue with the SQLUTB loading where duplicated keys or indexes were being processed incorrectly has been fixed.
3205697 (1118320)
- There is no longer an issue with loading data into a DB2 table if the table has more than 400 columns. The limit has been extended to 1000 columns. Previously, you would receive an error (SQLCODE: -99999, SQLSTATE: S1009) if the table had more than 400 columns.
3205384 (1118203)
- Loading data into a table with Implicitly Hidden columns now works as expected in DB2 LUW. An issue with the SQLUTB loading and unloading from and into DB2 LUW where Implicitly Hidden columns were being processed incorrectly has been fixed.
3205262 (1118244)
- Loading data using SQLUTB no longer results in an error SQLCODE=-803 when the REPLACE option is specified. An issue with the SQLUTB LOAD processing where the REPLACE option was being processed incorrectly has been fixed.
3194416 (1117254)
- There is no longer an issue with loading data using SQLUTB with REPLACE option in a middle job step when the JCL is submitted using a third party software Control-M. An issue of SQLCODE 2627 with the JCL loading multiple tables via Control-M being processed incorrectly has been resolved.
3194381 (1117469)
- There is no longer an issue with using SQL Server synonyms without a schema qualifier in SQLUTB LOAD. An issue with the SQL Server object name delimiter "[]" processed incorrectly has also been resolved.
3194381 (1117202)

SQL: OpenESQL

[Back to the list](#)

- The OpenESQL run-time system now handles WITH-HOLD cursor correctly when using FETCH FIRST orientation.
3225154 (1120007)

- You no longer receive an error in the OpenESQL Assistant when trying to run a query that used the same column referenced by an alias in two or more tables.
3223933 (1119902)
- The SQL Server datetime values are no longer returned with trailing zeros to a host variable of PIC X(26). An issue with the OpenESQL processing of datetime of SQL Server where padding characters were being processed incorrectly has been resolved.
3220692 (1119579)
- When calling stored procedures with null indicator host variables, the OpenESQL Run-Time System now executes correctly without returning an SQLCODE -10000 error.
3219732 (1119869)
- When multiple dynamic XA switches that use OpenESQL technology (such as MSSQL, PostgreSQL, and ODBC switches) are specified in an Enterprise Server instance, they are now started without an error in xa-prepare.
3218857 (1119445)
- The sqlerrd(3) in SQLCA now returns the correct number of rows affected by command INSERT and DELETE.
3217469 (1119456)
- OpenESQL runtime now handles the @@NESTLEVEL function correctly.
3211849 (1118757)
- An issue with how the SQL managed runtime handles char, varchar, nchar, and nvarchar types in SQL Server CLR stored procedures where a host variable size is greater than 8,000 has been resolved.
3211090 (1118718)
- The OpenESQL parser now handles SQL statements inside parenthesis correctly.
3210644 (1118643)
- The OpenESQL run-time now handles Informix ODBC errors correctly.
3208869 (1118722)
- The OESQL managed runtime now handles FINAL TABLE statements correctly.
3208718 (1118469)
- An issue with having to perform an ALLOCATE after every OPEN CURSOR to avoid an error has been resolved.
3206739 (1118395)
- Nested programs with the same PROGRAM-ID now insert records correctly.
3204730 (1118134)
- Native COBOL programs with multiple program id sections no longer failed to compile in 32-bit compilation. Previously, this failed with redefine symbol error messages.
3204730 (1118842)
- Closing a Windows Forms application compiled with DBMAN=ADO no longer fails with a NullReferenceException.
3202426 (1117914)
- An issue during COBOL compilation where incorrect error messages (such as "Access plan load error" or "DBRM not found in plan") could appear no longer occurs. This could happen in release 4.0 or later.
3202086 (1118511)
- OpenESQL now handles long column names without causing a truncated data warning.
3200934 (1117832)
- There is no longer an issue with expanding host variable groups regardless if whether the GEN-HV-FROM-GROUP directive is applied. An issue problem with the host variable group processing where non-sibling host variables were being processed incorrectly has been resolved.

- 3200753 (1117808)
- OpenESQL now handles and recognizes SQL Server's square brackets correctly.
- 3199039 (1117614)
- The OESQL JDBC run time now retrieves data correctly via the READ ONLY cursor.
- 3193117 (1117107)
- The DB2 SQL scripts for the following samples now include database creation - "OO WPF Book", "OO WPF Book EXEC ADO", and "WPF Book". Check the samples' readmes for instructions.

SQL Option for DB2

[Back to the list](#)

- When the XDB directive option IGNORE-NESTED is used without a parameter, XDB ECM now generates code in the outermost program only.
- 3218881 (1119399)
- XDB ECM now handles multi-level group host variables correctly.
- 3215815 (1119114)
- XDB ECM now handles user-defined SQLCODE data items correctly.
- 3215357 (1119066)
- XDB ECM now handles group host variables in the IN predicate correctly.
- 3213813 (1118991)
- A new property has been added to the XDB JDBC driver that enables byte array data to be treated as if it were encoded in the EBCDIC code page of the connection.
- 3203249 (1119097)
- XDB XA Switch logic now supports z/OS DB2 thread timeouts at XA_START time and reconnects stale connections but only at XA_START.
- 3221852 (1119701)
- A problem with XDB XA that caused a z/OS DB2 SAVEPOINT error when a program rolled back to the SAVEPOINT has been fixed.
- 3216066 (1119149)
- A thread abend in the XDB Link on Diagnostic Information DRDA flow has been resolved.
- 3199003 (1117688)
- A problem retrieving the value of the CURRENT PACKAGESET special register from the XDB Link DRDA/AR client to z/OS DB2 has been resolved.
- 3186735 (1116600)
- A problem that caused z/OS DB2 to return an error when using packages bound with DYNAMICRULES=BIND in addition to specifying COMMA as the Decimal Delimiter in the Options dialog has been fixed.
- 3204116 (1118276)
- The warning pop-up dialog box for an invalid connection no longer appears when connecting with the XDB ODBC Driver.
- 3208889 (1118496)
- A problem when using the XDB V11 emulation engine that caused the SQLWizard to improperly build UPDATE statements that update result sets has been fixed.
- 3209886 (1118568)
- A problem with the XDB CREATE USER SQL statement's SECONDARY ID clause has been resolved.
- 3206448 (1118263)

- Previously, the V11 radio button was not visible in the About tab of the XDB Server Configuration Utility even when the V11 engine DLL was available.
3198729 (1117593)
- A problem with recalculating field values during the projection of the result for SUBSTR/SUBSTRING scalars with parameters 2 and/or 3 that contained field values has been resolved.
3196219 (1117383)
- A problem caused by a case expression built in reverse order has been resolved.
3195822 (1117449)
- The XDB Link DRDA/AR has been enhanced to process z/OS DB2 diagnostic information in all modes.
3187411 (1116687)
- When a location was successfully closed, a problem that prevented it from being marked as closed caused an error to be generated when subsequently setting a location off-line. This has been fixed.
3184848 (1116525)
- An issue with labeled duration arithmetic or row change timestamps using timestamps with precision greater than six has been resolved.
3181837 (1116189)
- An issue causing an empty result set where index queues used to optimize correlated subqueries were reset when the correlated subquery contained an IN predicate with a list of values has been resolved.
3199958 (1117713)
- The XUTLB grammar that processes LOAD statements now supports a NUMRECS clause between the INTO TABLE clause and the column definition list.

XML Support

[Back to the list](#)

- XML PARSE now handles ISO-8859-15 encoded strings correctly in 64-bit mode.
3220045 (1119568)
- The XML run time now handles namespace prefixes correctly in the output XML document.
3219503 (1119447)
- XML PARSE now returns XML EVENT correctly without repeating the same event.
3219154 (1119556)
- The XML run-time system now detects and outputs the special xsi namespace correctly.
3201811 (1117879)
- The PREXML preprocessor now handles the COBOL source correctly, and prevents an unhandled exception appearing in the IDE.
3200436 (1117735)
- If an environment variable is used in the ASSIGN TO clause, the XML runtime now returns the end-of-file status correctly.
3220566 (1119552)
- The managed XML syntax support runtime now cleans up all the unwanted empty XML tags.
3209096 (1118515)
- XML PARSE now parses the subsequent parts of an XML document correctly.
3201432 (1117819)

Other Issues Resolved in This Release

The numbers listed are the Support Incident Numbers followed by the Reported Problem Incident (RPI) number (in parentheses).

- 3220454 (1119529)
- 3205144 (1118152)
- 3216998 (1119233)
- 3168018 (1115086)
- 2868839 (1105831)
- 3222038 (1119767)
- 3184732 (1116467)
- 3224515 (1119919)
- 3136118 (1112519)
- 2885283 (1108043)
- 3211043 (1118683)
- 3119471 (1110898)
- 3201628 (1117842)
- 2820860 (1099521)
- 3222960 (1119817)
- 3220991 (1119565)
- 3208034 (1118409)
- 3221354 (1119662)

- 3208489 (1118495)
- 3196128 (1117344)
- 3133097 (1112263)
- 3167774 (1115016)
- 3222951 (1119971)
- 3221465 (1119695)
- 3208613 (1118449)
- 3208093 (1118467)
- 3207104 (1118323)
- 3204665 (1118597)

Unsupported Functionality

This section includes information about features or functionality that are no longer supported.

- The SafeNet Sentinel licensing system has been deprecated and will be not available in this product starting with the next major release after release 9.0. The SafeNet Sentinel licenses will not be supported after release 9.0 and you need to use AutoPass licenses if you use these releases.

You can replace your SafeNet Sentinel licenses with AutoPass licenses starting with release 8.0. Contact Micro Focus SupportLine for further information.

- The HOSTSIGNS Compiler directive is no longer supported. Micro Focus recommends that you use the following Compiler directives instead: SIGN-FIXUP, HOST-NUMMOVE, and HOST-NUMCOMPARE. This is a change since version 3.0 of this product.

Installation

Supported Third Party Software

The table below lists some of the software requirements and Third Party Software this product is tested with.

For full details on the supported software, see *Software Requirements* and *Additional Software Requirements* in this product's install notes.

Software	Requirements
Integrated Development Environment	Eclipse 4.8 - installed with Enterprise Developer. Eclipse 4.7 is also supported.*
Java	64-bit Java 8 is required for running Eclipse Java 8 (32 or 64-bit versions), 11 (64-bit only) is supported for running applications
Java application servers	Tomcat 9.0.x JBoss EAP 7.1.x (where x>=4), and 7.2.x Oracle WebLogic 12.2.1 IBM WebSphere 9.0 and Liberty 19.0.0.x
Relational databases	Oracle 18c and 19c SQL Server 2014, 2016, 2017, and 2019 DB2 LUW 10.5, 11.1, and 11.5 EDB PostgreSQL 10.x (where x>=5), and 11.x MySQL 5.7
Middleware	IBM WebSphere MQ 8.0
Platform support	See http://supportline.microfocus.com/prodavail.aspx

* See *Installing Enterprise Developer into other instances of Eclipse* in your Product Help.

Before Installing

Downloading the Product

1. Use the download links in your Electronic Product Delivery email.

For more information follow the links for the installation instructions and the End User License Agreement.

2. Alternatively, you can download the product from the *Product Updates* section of the [Micro Focus SupportLine](#) Web site.

On Windows

System Requirements

Hardware Requirements

Enterprise Developer has the following requirements in addition to the requirements of Eclipse. See the Eclipse documentation for details of its requirements.

In general, most modern machines will have the required processor and available RAM to run the Micro Focus products under Windows effectively. For planning purposes, you should consider having a minimum of 2GB of RAM though Micro Focus recommends at least 4GB of RAM for optimal performance.

The disk space requirements for Windows are, approximately:

Enterprise Developer
3.5GB

Note: The disk space requirements include the size of the Eclipse IDE and the version of Java and the .NET Framework provided with the Enterprise Developer setup file. This includes the space needed to cache information locally so that you can modify the installation without the original source media.

z/Server requirements

z/Server has the following hardware requirements:

- IBM mainframe model zEC12 or later is required for installing and using MFA Server. If your hardware does not meet these requirements please contact Micro Focus support.

Operating Systems Supported

For a list of the supported operating systems, check the *Product Availability* section on the Micro Focus SupportLine Web site: <http://supportline.microfocus.com/prodavail.aspx>.

Also note the following:

- Enterprise Developer installs fully only on 64-bit Windows platforms. On 32-bit Windows, the setup file does not install some of the components. See *Issues with the Installation* in *Known Issues and Restrictions*.
- You to produce both 64-bit and 32-bit applications with Enterprise Developer on 64-bit operating systems.
- This product can be installed on earlier versions of Windows but it has not been tested on them.
- Support for development and deployment on Windows 7 has been discontinued.
- Support for development on Windows 8 and Windows Server 2012 has been discontinued. These platforms are still supported for deployment. Windows 8.1 and Windows Server 2012 R2 are supported.
- The Server Core form of Windows Server 2019 is not supported.

Software requirements

Note: This product includes OpenSSL version 1.1.1c.

The setup file will check your machine for whether the prerequisite software is installed and will install any missing prerequisites and the product components.

Eclipse requirements

- The setup file installs Enterprise Developer and the 64-bit Eclipse 4.8.

Some earlier versions of Eclipse are also supported. See *Installing Enterprise Developer into other instances of Eclipse* in the *Advanced Installation Tasks*.

- Enterprise Developer installs fully only on 64-bit Windows platforms. On 32-bit Windows, the setup file does not install some of the components. See *Issues with the Installation* in *Known Issues and Restrictions*.
- Enterprise Developer supports both the 32-bit and the 64-bit Eclipse. You can use the 64-bit Eclipse to create both 32-bit and 64-bit applications.

Software requirements on Windows

- Java 8 (64-bit) is required to run the Eclipse IDE. The minimum recommended version is AdoptOpenJDK's OpenJDK 8 (u202) with Hotspot, which the Windows product installs automatically. Java 8 (32 or 64-bit versions), and Java 11 (64-bit version only) are supported for executing JVM COBOL code and for native COBOL and Java interoperability. You can download AdoptOpenJDK's OpenJDK 8 with Hotspot from [AdoptOpenJDK's Web site](#) and unpack the archive anywhere on your machine.

Note: Eclipse does not run using Java 11.

- Enterprise Developer requires:
 - A 32-bit Java installation if using the 32-bit Eclipse.
 - A 64-bit Java installation if using the 64-bit Eclipse.
- The setup file also installs Microsoft's Visual C++ 2012, 2013 and 2017 Redistributables.
- Microsoft Windows SDK and Microsoft Build Tools: Various actions and operations within your COBOL development environment depend on certain files that Microsoft distributes in the following packages: the Windows SDK package and the Microsoft Build Tools package. See *Microsoft Package Dependencies* for a full list of actions and operations that require one or both of these packages.

By default, the product installation installs the latest versions of the Microsoft Windows 10 SDK, and the Microsoft Build Tools for Visual Studio 2017, to their default locations.

If you need to use any other version of these packages, or use them installed to a non-default location, use the `cb1ms` command line utility post-installation to manage this; see *Managing the Microsoft Build Tools and Windows SDK Packages* for more information.

See *Java Support Restrictions* in the product help for any considerations when using Eclipse and Java.

Other Requirements

Important: For local servers, you do not need to install the Micro Focus License Administration tool separately, as the setup file installs a new Enterprise Developer client and a new licensing server on the same machine.

If you have a network server, you must update the license server before installing the product as the client is not able to communicate with license servers of versions older than 10000.2.660. On Windows, you can check the version of your license server by clicking **Help > About** in the Micro Focus License Administration tool. To check the version of the license server on UNIX, run `/var/microfocuslicensing/bin/mfcesver` or `/var/microfocuslicensing/bin/cesadmintool.sh`.

If Micro Focus License Manager version 10000.2.02070 or older is installed, it must be uninstalled before the product installation or upgrade can continue.

You can download the new version of the license server software from the [Micro Focus SupportLine](#).

Additional Software Requirements on Windows

To ensure full functionality for some Enterprise Developer features, you might be required to obtain and install additional third-party software in addition to the prerequisite software installed automatically by the Enterprise Developer setup file.

[Click here](#) to see this information on the Product Documentation pages on Micro Focus SupportLine.

Product Co-Existence

 **Note:** The following applies to Windows only.

- Enterprise Developer and Enterprise Server (or Enterprise Test Server) cannot coexist on the same machine.
- Visual COBOL and Enterprise Developer cannot coexist on the same machine regardless of which IDE (Visual Studio or Eclipse) you install.

Installation Restrictions and Requirements

Before starting the installation you should consider the following:

- Visual COBOL and Enterprise Developer cannot coexist on the same machine.
- You need to be logged in with a user-ID that has write access to the registry structure under HKEY_LOCAL_MACHINE, HKEY_CLASSES_ROOT, and HKEY_CURRENT_USER so the installation software can set the environment appropriately. You also need to be logged on with Administrator privileges.
- Various actions and operations within your COBOL development environment depend on certain Microsoft files distributed in the following packages: the Windows SDK package and the Microsoft Build Tools package. By default, a standard product installation downloads and installs these. Refer to *Microsoft Package Dependencies* to see if these packages are required. If you do not plan to use your development tool in a way that will depend on any of these packages, you can run a non-standard installation, which will skip their download and installation, thus saving disk space and time taken for installation. Refer to *Advanced Installation Tasks* for details on the available installation options.
- If you already have Microsoft Build Tools for Visual Studio 2017 installed, you must ensure that it contains the Visual C++ build tools workload (or at least the individual components contained in that workload) before you run this installation.

On UNIX

System Requirements for Micro Focus Enterprise Developer UNIX Components

Hardware Requirements

The disk space requirements for Micro Focus Enterprise Developer UNIX Components are approximately:

Platform	Installer type	Setup file size	Disk space required for the installation	Disk space required for running the product	Sentinel RMS license server
POWER running AIX	Micro Focus	601 MB	2.40 GB	1.20GB	41 MB
HP IA	Micro Focus	1.03 GB	4.10 GB	2.05 GB	79 MB
System Z running Red Hat Linux	Micro Focus	485 MB	1.95 GB	970 MB	39 MB

Platform	Installer type	Setup file size	Disk space required for the installation	Disk space required for running the product	Sentinel RMS license server
x86-64 running Red Hat Linux	Micro Focus	743 MB	2.98 GB	1.49 GB	50 MB
SPARC running Solaris	Micro Focus	603 MB	2.42 GB	1.21 GB	42 MB
x86-64 running Solaris	Micro Focus	516 MB	2.07 GB	1.04 GB	33 MB
System Z running SUSE SLES	Micro Focus	348 MB	1.40 GB	696 MB	39 MB
x64 running SUSE SLES	Micro Focus	501 MB	2.01 GB	1.01 GB	50 MB
x64 running Ubuntu	Micro Focus	505 MB	2.03 GB	1.02 GB	50 MB
x86-64 running CentOS	Micro Focus	743 MB	2.98 GB	1.49 GB	50 MB

Operating Systems Supported

For a list of the supported operating systems, check the *Product Availability* section on the Micro Focus SupportLine Web site: <http://supportline.microfocus.com/prodavail.aspx>.

Software Requirements for Micro Focus Enterprise Developer UNIX Components

These are the software requirements for Micro Focus Enterprise Developer UNIX Components:

- The "awk", "ed", "ps", "sed", "tar", "sed" and "which" "tar" utilities must be installed and added to the PATH.
- The pax archiving utility is required by the setup file. Pax is distributed with most UNIX/Linux systems but, if it is missing, you must install it separately. To verify pax is installed, run `pax --help` or `pax --version` at the command line.
- Required libraries for Red Hat and SUSE Linux platforms - The installer checks that both the 32-bit and 64-bit libraries listed below are installed on both 32-bit and on 64-bit Operating Systems for this product to install and work correctly.

If installing on a 64-bit OS, the 32-bit libraries are not installed by default and must be installed before you start the installation.

Library	32-bit Library Name	64-bit Library Name	Platform						
			s390	SUSE 12	SUSE 15	Red Hat 6x	Red Hat 7	Red Hat 8	
glibc	glibc-*.i686	glibc-*.x86_64	glibc-*.s390				X	X	X
libgcc	libgcc-*.i686	libgcc-*.x86_64	libgcc-*.s390				X	X	X

Library	32-bit Library Name	64-bit Library Name	Platform						
			s390	SUSE 12	SUSE 15	Red Hat 6x	Red Hat 7	Red Hat 8	
libstdc++	libstdc++-i686	libstdc++-x86_64	libstdc++-s390				X	X	X
glibc-locale	glibc-locale-32bit	glibc-locale-2		X	X				
glibc-devel	glibc-devel-i686	glibc-devel-x86_64	glibc-devel-s390				X	X	X
elfutils-libelf	elfutils-libelf.i386 or elfutils-libelf.i686	elfutils-libelf.x86-64	N/A				X	X	X
libelf-devel	elfutils-libelf.i386 or elfutils-libelf.i686	elfutils-libelf.x86-64	N/A				X	X	X
libelf-devel	libelf-devel-32bit-0.137-8.19	libelf-devel-0.137-8.19	N/A	X	X		X		
libelf1	libelf1-32bit-0.137-8.19	libelf1-0.137-8.19	N/A	X	X				
gcc ²	gcc*.i686	gcc*x86_64	X	X	X		X	X	X
cpp ²		cpp*x86_64					X	X	X
ld ²	Binutils*.i686	Binutils*x86_64	X	X	X		X	X	X

- ¹ On SUSE 12 AND 15, you can only install the 64-bit version of Enterprise Developer. The glibc-locale-32bit library is still required by the SafeNet Sentinel licensed components.
- ² On Red Hat, these libraries are required to enable COBOL and PL/I to compile.
- * Additional libraries required to use the core_on_error runtime variable. The gdb packages (for the GNU Project Debugger) can be installed from the install media for your OS.
- ** Operating system libraries required for PL/I support on both SUSE and Red Hat.

- Libraries marked with an 'X' are not included in the platform and need to be installed separately.

Visit the [Red Hat Web site](#) for more information.

- Xterm, the terminal emulator for the X Window System, is part of your UNIX/Linux distribution but is not installed by default. Use your UNIX/Linux installation media to install it.
- Java 8 (64-bit) is required to run the Eclipse IDE. The minimum recommended version is AdoptOpenJDK's OpenJDK 8 (u202) with Hotspot, which the Windows product installs automatically. Java 8 (32 or 64-bit versions), and Java 11 (64-bit version only) are supported for executing JVM COBOL code and for native COBOL and Java interoperability. You can download AdoptOpenJDK's OpenJDK 8 with Hotspot from [AdoptOpenJDK's Web site](#) and unpack the archive anywhere on your machine.

Note: Eclipse does not run using Java 11.

Java 8 (64-bit) is required to run the Eclipse IDE. The minimum recommended version is AdoptOpenJDK's OpenJDK 8 (u202) with Hotspot, which the Windows product installs automatically. Java 8 (32 or 64-bit versions), and Java 11 (64-bit version only) are supported for executing JVM COBOL code and for native COBOL and Java interoperability. You can download AdoptOpenJDK's OpenJDK 8 with Hotspot from [AdoptOpenJDK's Web site](#) and unpack the archive anywhere on your machine.

Note: Eclipse does not run using Java 11.

Note:

- On AIX and zLinux, you need to have IBM's JDK. The earliest supported release of IBM's JDK is 7.0 Service Refresh 8. If you install IBM's JDK 8, on AIX you must install its latest fix - JDK 8 SR5 FP16. You can get IBM's AIX JDK from [IBM's Web site](#).
 - On HP-UX, you need to have HP-UX JDK. The earliest supported release of HP-UX is JDK 7.0.11. You can get the HP-UX Java JDK from [HP's Web site](#).
 - On Solaris platforms (both SPARC and Intel) only the 64-bit version of Java 8 and later is supported.
- To execute JVM COBOL code, you need to set the environment as follows:
 - You need to set the JAVA_HOME environment variable. When installing the product, set this variable to a 64-bit Java installation or the installation terminates. For example, execute the following:

```
export JAVA_HOME=java_install_dir
```

where *java_install_dir* is the path to the JAVA installation directory such as `/usr/java/javan.n`
 - You need to add \$JAVA_HOME/bin to your system PATH variable. To do this, execute:

```
export PATH=$JAVA_HOME/bin:$PATH
```
 - You need to set the LANG environment variable to pick up localized messages. The LANG settings are English and Japanese only.
 - GNOME menus and buttons have been standardized across all applications so that icons are not displayed by default. To keep the icons and the look and feel of previous versions, enable the `menus_have_icons` property with the command:

```
gconftool-2 --type boolean --set /desktop/gnome/interface/menus_have_icons true
```

Additional Software Requirements for Micro Focus Enterprise Developer UNIX Components

To ensure full functionality for some Enterprise Developer features, you might be required to obtain and install additional third-party software in addition to the prerequisite software installed automatically by the Enterprise Developer setup file.

[Click here](#) to see this information on the Product Documentation pages on Micro Focus SupportLine.

UNIX and Linux Installer Issues

Installing on Linux

On Linux, the RPM installer for Enterprise Developer for Eclipse installs a 64-bit version of Java. When you start the installation, if the 32-bit version of Java is already installed on your Linux machine, you might not be able to install Enterprise Developer. This is a *known issue* with the Oracle Java installers for Linux which prevents you from installing both the 32-bit and the 64-bit versions of Java on the same machine. To work around this problem:

- Download the 64-bit Java distribution in a compressed .tar format from the Oracle Web site.
- Untar the distribution into a location different from the one used for the 32-bit Java version. For example, untar in `/usr/local/java64` and not in `/usr/local/java`.
- Set `JAVA_HOME` and `LD_LIBRARY_PATH` to the 64-bit version of Java so that it is used to install and run Enterprise Developer.

Installing while using AFS/Kerberos authentication

If you are using AFS/Kerberos authentication to log onto your Linux system then you need to ensure you have a local user ID which SOA and Enterprise Developer components of the product can use. This user ID must be set up prior to running the installer. When running the installer you need to specify `-ESadminID=[User ID]` on the command line so it is used by the installer.

License Server

You need to configure the computer hostname to ensure the license server will start properly.

To avoid performance issues, "localhost" and the computer hostname must not both be mapped to IP address 127.0.0.1. You should only map "localhost" to IP address 127.0.0.1.

The following is an example of how to specify these entries correctly in the `/etc/hosts` file:

```
127.0.0.1 localhost.localdomain localhost
IP machinelonghostname machineshorthostname
```

where *IP* is the unique IP address of the computer in `xx.xx.xx.xx` format.

Basic Installation

The instructions in this section apply when you are performing a basic installation of this product for the first time. If you are an administrator, you can perform a basic installation on a local machine before performing a more advanced installation when rolling out the product to developers within your organization.

For considerations when installing this product as an upgrade, for additional installation options or non-default installations and for installing the mainframe components, see *Advanced Installation Tasks* in your product Help.

Installing on Windows

Note:

- This version of the product is a full install.
- If you have an earlier version of Enterprise Developer installed on your machine, check *Installing as an Upgrade* before you start the installation - see *Advanced Installation Tasks*.

These are the steps to install Enterprise Developer:

1. Run the `ede_60.exe` file and follow the wizard instructions to complete the installation.

By default, this installs Enterprise Developer in the %ProgramFiles(x86)%\Micro Focus \Enterprise Developer folder and installs a full version of Eclipse 4.8 64-bit, with the Micro Focus plugins already installed, in the C:\Users\Public\Micro Focus\Product Name\eclipse directory.

The setup file installs any missing prerequisite software as listed in the topic *Software Requirements*.

 **Note:** See *Advanced Installation Tasks* for information about non-default installation tasks.

Installing Micro Focus Enterprise Developer UNIX Components

 **Note:** Micro Focus offers two types of installers on UNIX and Linux - a proprietary Micro Focus installer for installing on UNIX and Linux and a standard RPM (RPM Package Manager) installer for installing on Linux. See your product Help for instructions on how to use the RPM installer.

These are the steps to install this product using the Micro Focus installer:

1. Give execute permissions to the setup file:

```
chmod +x setup_entdev_6.0_platform
```

2. Run the installer from the Process User ID login:

```
./setup_entdev_6.0_platform
```

When the installer starts it will prompt you to enter the superuser password so it can perform operations that require root permissions.

 **Note:** On Ubuntu, the prompt for superuser password is not available. On this platform you must either log in as root or use the `sudo` command to get root permissions before you run the installer.

The COBOL environment is installed by default into `/opt/microfocus/EnterpriseDeveloper`, (COBDIR).

SafeNet Sentinel considerations

- The installation of this product could affect the SafeNet Sentinel licensed components running on your machine. During installation licensing is shutdown to allow files to be updated. To ensure the processes running on your machine are not affected, you need to use the `-skipsafenet` option, which skips the installation of SafeNet:

```
./setup_entdev_6.0_platform -skipsafenet
```

- To protect the SafeNet Sentinel installation from accidental updating you can create an empty file named `SKIP_SAFENET_INSTALL` in `/var/microfocuslicensing/` as follows:

```
touch /var/microfocuslicensing/SKIP_SAFENET_INSTALL
```

While the file is present, the SafeNet installer does not make changes to the installation or shutdown the running license daemons. If licensing needs to be updated later, remove the file and install Sentinel RMS server manually.

 **Note:**

During the installation process, the installer configures the product's Enterprise Server System Administrator Process User ID. The Process User ID will be the owner of all Enterprise Server processes except the one for the Micro Focus Directory Server (MFDS). The Directory Server process (Enterprise Server Administration) runs as root as this allows it to access the system files and ports.

All Enterprise Server processes you start from Enterprise Server Administration run under the Process User ID which can affect the file access and creation.

By default, the installer uses the login id of the user that runs the installer for the Process User ID. To change the user id after you complete the installation, execute `$COBDIR/bin/casperm.sh`.

Advanced Installation Tasks

This section includes instructions about how to perform a non-default installation, install this product as an upgrade, or about how to install the additional components.

The advanced installation tasks include:

- *Installing as an Upgrade* - included in these Release Notes
- *Command line installation options* - included in these Release Notes
- *Installing using an RPM installer on Linux* - available in the product Help and on the Product Documentation pages on Micro Focus SupportLine
- *Installing and licensing Micro Focus Rumba* - available in the product Help and on the Product Documentation pages on Micro Focus SupportLine
- *Installing into other instances of Eclipse* - available in the product Help and on the Product Documentation pages on Micro Focus SupportLine
- *Installing the Mainframe Components*, - Mainframe Access Server, Application Workflow Manager into IDz, z/Server - available in the product Help and on the Product Documentation pages on Micro Focus SupportLine
- *Installing on Microsoft Terminal Server and Citrix* - available in the product Help and on the Product Documentation pages on Micro Focus SupportLine

[Click here](#) to see this information on the Product Documentation pages on Micro Focus SupportLine.

On Windows

Installing as an Upgrade

Installing this release as an upgrade will automatically uninstall any Patch Updates of the older version of the product you have installed on your machine.

- If you have been using the mainframe components of Enterprise Developer for z Systems, see *Installing z/Server as an Upgrade* for recommendations about how to upgrade your z/Server installation. Also, check *Backward Compatibility of AWM Models* for information about changes that affect your existing AWM models.
- Before installing this release as an upgrade, ensure you create a back-up of your Enterprise Server configuration. To do this, on the Enterprise Server Administration home page, click **Export** and then select **Export Enterprise Server configuration and Security Manager definitions**. This creates a backup folder in the `c:\programdata\micro focus\Enterprise Developer\MFDS`. You can restore the Enterprise Server configuration after installing this release - click **Import** on the Enterprise Server Administration home page.

Enterprise Developer Installation Options

To see what parameters you can use, execute the following from the command line:

```
install-file /help
```

where *install-file* for the following products is as follows:

Enterprise Developer

ede_60.exe

See the *Examples* section further in this topic for examples of some of the parameters you can use.

Directory considerations

- You must have read and write access for every directory accessed during the installation.
- You can override the default installation folder using the `InstallFolder` parameter.
- Installing creates a group of log files prefixed `Micro_Focus_` in the `%temp%` folder, by default. To change the location or name, use the `/log` parameter on your Setup command line and specify the path and file name, for example:

```
/log drive:\path\LogFilename
```

Skipping installation of the Microsoft package dependencies

A standard installation downloads and installs the latest versions of the Microsoft Build Tools (for Visual Studio 2017) and the Windows 10 SDK packages to their default locations. Using the following option, you can skip installation of these packages, thus reducing the footprint and duration of the installation. See *Microsoft Package Dependencies* to see if you can safely skip installing these packages.

```
ede_60.exe skipmstools=1
```

Offline installations

An offline installation is one where the client running an install is not connected to the internet; the problem this presents is that the installer cannot download and install certain file and package dependencies; see *Microsoft Package Dependencies*. In such circumstances, an administrator (or at least someone connected to the internet) must download and make any dependencies available on the local network beforehand.

To prepare an offline installation, the administrator should run their own (online) installation using the `downloadmstools` parameter: this downloads the package dependencies to `<directory>`, which should be a fully-qualified path to a location accessible to the client when they run an installation.

```
start /wait vce_60.exe /q downloadmstools=<directory>
```

A client can then run an offline installation by pointing their installer at the location of the packages:

```
vce_60.exe installmstools=<directory>
```

This command runs a full product install; during which it uses the locally-accessible `<directory>` to install the package dependencies.

Installing silently

You can install Micro Focus products silently by specifying `/q` at the command line and using command line parameters to specify the installation directory (`installfolder=path`), user information, and which features to install. You must execute the command with superuser permissions.

```
start /wait install-file.exe /q [parameters]
```

Examples

- To silently install Enterprise Developer into a directory other than the default:

```
start /wait ede_60.exe /q InstallFolder=c:\DirectoryName
```

- If you want to silently install the Eclipse IDE in a location other than the default, execute:

```
start /wait ede_60.exe /q InstallFolder2=c:\EclipseInstallDirectory
```

- To silently install Rumba+ Desktop during the silent install of Enterprise Developer:

```
start /wait ede_60.exe /q RumbaCheckbox=1
```

Microsoft Package Dependencies

Various actions and operations within your COBOL development environment depend on certain files that Microsoft distributes in the following packages: the Windows SDK package and the Microsoft Build Tools package.

There is a dependency on the Microsoft Windows SDK if you:

- Produce COBOL `.exe` or `.dll` files.
- Call Windows APIs from your COBOL `.exe` or `.dll` files.
- Link a C object file into a COBOL `.exe` or `.dll` file.
- Call Windows APIs from a C object file linked into a COBOL `.exe` or `.dll` file.
- Create MIDL files for OLE RPC.

There is a dependency on the Microsoft Build Tools if you:

- Produce COBOL `.exe` or `.dll` files.
- Manage `.lib` files.
- Convert resource files to object modules.

A standard installation downloads and installs the latest available versions of the Windows 10 SDK and the Microsoft Build Tools for Visual Studio 2017 to a default location.

If you distribute a COBOL product installation to clients that do not have access to the internet, then you need to have downloaded these packages and placed them in an accessible place on the network before clients can run an 'offline installation'. The installer includes options to achieve this: `downloadmstools` enables you to download the required packages to a specific location; and `installmstools` enables an offline client to install the packages from a local network location.

If you do not use any of the features described above, you can use an install parameter (`skipmstools=1`) that will skip the download and installation of these dependencies.

All of these installation options are discussed in more detail in the *Installation Options* topic for your product.

One of the final steps of the installation process configures the downloaded and installed package versions for use in your COBOL environment. You can view these versions using the Microsoft Build Tools and Windows SDK Configuration Utility - see *Managing the Microsoft Build Tools and Windows SDK Packages*. This utility also enables you to specify alternative versions should you need to depend on a specific package other than the one downloaded, or one stored in a non-default location.

Installing and Licensing Micro Focus Rumba+ Desktop

The Enterprise Developer setup file includes Micro Focus Rumba+ Desktop 10.1 which you can install as an optional component. The license for Enterprise Developer also licenses all components of Rumba+ Desktop (for example, Rumba+ Desktop Office, Rumba+ Desktop for Mainframe, UNIX, AS400, and the TN3270 mainframe display within Enterprise Developer).

 **Note:** Micro Focus Rumba+ Desktop versions 10.1 provide integration with Enterprise Developer where you can use a Rumba+ Desktop TN3270 Mainframe Display within the IDE in order to run applications.

Installation considerations:

- If you are installing Enterprise Developer onto a machine that does not have Rumba+ Desktop installed, it is recommended that you select the Rumba+ Desktop option when you start the installation. This installs all of the components of Rumba+ Desktop including the one you need to establish a mainframe 3270 connection (Rumba+ Desktop for Mainframe).
- Installing Rumba+ Desktop as part of this release of Enterprise Developer will update any older version of Rumba+ Desktop installed and licensed on your machine.

 **Note:** Micro Focus recommends that you upgrade older versions of Rumba+ Desktop to the one installed with Enterprise Developer. However, if you want to keep an older version of Rumba+ Desktop, you can choose not to install Rumba+ Desktop when you start the Enterprise Developer installation. In this case, the TN3270 Mainframe Display will not be available for use from within Enterprise Developer.

- If a version of Rumba+ Desktop more recent than version 10.1 is installed and licensed on your machine, you can choose not to install Rumba+ Desktop as part of the Enterprise Developer installation. The TN3270 Mainframe Display provided with this version of Rumba+ Desktop may be supported within Enterprise Developer but might not have been tested.

On UNIX

Installing as an Upgrade

This release works concurrently with the previous version of Micro Focus Enterprise Developer UNIX Components, so you do not need to uninstall it.

Install the latest version in a different location and set the environment to point to it. To do this, run the Micro Focus Enterprise Developer UNIX Components installer with the `-installlocation` option:

1. Execute the following command:

```
./InstallFile -installlocation="/opt/microfocus/EnterpriseDeveloper"
```

 **Note:** You can use variables when specifying an absolute path for `-installlocation`. For example, the following examples are equivalent:

```
-installlocation="/home/myid/installdir"
```

```
-installlocation="$HOME/installdir"
```

2. Execute `cobsetenv` to set the environment and point to the new install location:

```
. <product-install-dir>/bin/cobsetenv
```

 **Note:** `cobsetenv` is only compatible with POSIX-like shells, such as `bash`, `ksh`, or `XPG4 sh`. It is not compatible with C-shell or pre-XPG4 Bourne shell.

Micro Focus Enterprise Developer UNIX Components Installation Options

Installing into a different location

To install in a different location use the `-installlocation="Location"` parameter to specify an alternative directory location. For example:

```
./setup_entdev_6.0_platform -installlocation="full path of new location"
```

 **Note:** You can use variables when specifying an absolute path for `-installlocation`. For example, the following examples are equivalent:

```
-installlocation="/home/myid/installdir"
```

```
-installlocation="$HOME/installdir"
```

You can see details about which additional parameters can be passed to the install script if you enter the `-help` option.

Configuring the Enterprise Server installation

You can use the following options to configure the Enterprise Server installation: [`-ESsysLog="Y/N"`] [`-ESadminID="User ID"`] [`-CASrtDir="location"`], where:

-ESsysLog Use this to enable ("Y") or disable ("N") Enterprise Server system logging. Logging is enabled by default. Log files are saved in `/var/mfcobol/logs`.

-ESadminID Sets the Enterprise Server System Administrator Process User ID from the command line - for example, `-ESadminID="esadm"`. The default user ID is the one that runs the installer.

-CASrtDir Specifies the location where the Enterprise Server run-time system files are placed - for example, `-CASrtDir="/home/esuser/casrt/es"`. The default location is `/var/mfcobol/es`.

Installing Silently

You can install Micro Focus products silently by using command line parameters to specify the installation directory, user information, and which features to install. You must execute the command with superuser permissions.

You can use the following command line arguments to install silently on UNIX/Linux. You need to execute the commands as root:

```
-silent -IacceptEULA
```

For example, execute:

```
setup_filename -silent -IacceptEULA
```

Installing on Microsoft Terminal Server and Citrix

Note: This document is a work-in-progress. Check the documentation for Enterprise Developer in the *Product Documentation* section of the Enterprise Developer SupportLine Web site for its most recent version.

Microsoft Terminal Server and Citrix (TS/Citrix) are environments for running multiple instances of a single user product. They are not platforms where a single-user product can be made to perform as a multi-user product.

When running Enterprise Developer on TS/Citrix machine, there might be some implications to components of Enterprise Developer which could cause potential conflicts between a 'per-user session' compared to the standard 'per machine' setup. The following components of Enterprise Developer require special configuration:

- Eclipse workspaces and projects
- The Enterprise Server component - the Run-Time System product for JCL, CICS and IMS operations
- The database management service

You can use Enterprise Developer with TS or with any Citrix version certified for use with Eclipse; however, a separate end-user license is required for each user who accesses Enterprise Developer, even if it is running on a single machine. See your *End User License Agreement* for clarification.

Note: Micro Focus Enterprise Developer does not officially support TS/Citrix. However, it will run on any prerequisite Operating System that is supported under TS/Citrix.

Capacity planning

Multi-user capacity planning for TS/Citrix does not scale linearly, and the calculations required for this planning are not directly related or specific to any Micro Focus technology. Micro Focus recommends that you consult with Microsoft or Citrix Systems, respectively, about the server sizing and capacity planning, based on hosting the required number of "rich" Windows desktops (e.g. using a singleton desktop build as a baseline).

Installing Enterprise Developer

To install Enterprise Developer for use with TS/Citrix:

1. Log on to the physical terminal or Citrix server with a user ID that has administrator privileges.
2. Use the download links in your Electronic Product Delivery email.
3. Follow the links for the installation instructions and the End User License Agreement.

Configuring Enterprise Developer

Follow the links below for details on how to configure the individual Enterprise Developer components.

Customizing the Installation, the Workspace and the Projects

Using Enterprise Developer for Eclipse under TS/Citrix

For considerations about how to use Eclipse under TS/Citrix refer to the [Eclipse product help](#).

Micro Focus recommends you set up Enterprise Developer for Eclipse so that each user has their own configuration area and you make the `configuration` folder within the Eclipse installation read-only. (Enterprise Developer for Eclipse is installed on the TS/Citrix machine into `%ProgramFiles(x86)%\Micro Focus\Enterprise Developer` with the Eclipse installation stored in `C:\Users\Public\Micro Focus\Enterprise Developer\eclipse`.)

To ensure that each user will have their own configuration area, you need to set up Eclipse as follows:

1. On the TS/Citrix machine, start Enterprise Developer once, make any required customizations to the IDE and then close it.
2. Using Windows Explorer, navigate to `C:\Users\Public\Micro Focus\Enterprise Developer\eclipse` and open the `eclipse.ini` file with an editor.
3. Add the following code before the `-vmargs` entry:

```
-configuration
@user.home\EclipseConfig
```

4. Using Windows Explorer, navigate to the Eclipse installation folder and from the folder properties make the `configuration` folder **Read Only** for the group that will work with Enterprise Developer for Eclipse.

This ensures that each user that starts Enterprise Developer for Eclipse under TS/Citrix can only see their own workspaces and that they have their own `EclipseConfig` folder specified by the `eclipse.ini` file.

Eclipse workspaces

An Eclipse workspace is a folder on the disk where the project and application files are stored. The default location for an Eclipse workspace is in the user's area (for example, `c:\users\username\`). It is not possible to share workspaces so each user must have their own.

We suggest that you create Eclipse workspaces in an area on a shared network drive, naming each workspace folder with an individual user ID.

Also provide a startup script that maps the drive dynamically using share names derived from the user ID.

Tip: Use the `net use` command to connect to, remove and configure the connections to the mapped drives.

Template projects

Create and configure template projects to distribute among your users. Templates must not include fully qualified paths. You can store the projects in a source control system and make them available so that individual users can import them into their own workspace.

Enterprise Server Installation Options

When you install Enterprise Developer, the setup file also installs the Enterprise Server component on the same machine. There are different ways in which you can configure and use Enterprise Server regions in TS/Citrix environments. This topic outlines two of the methods and explains what the implications of choosing them are:

- Use the Enterprise Server component as part of Enterprise Developer installed on the TS/Citrix machine

- Install Enterprise Server or Enterprise Test Server on a separate server

Use the Enterprise Server component as part of Enterprise Developer installed on the TS/Citrix machine

On the client machines, the developers each use a clone of Enterprise Developer. They also use a clone of Enterprise Server to create and manage multiple server instances as required.

While this option provides the greatest flexibility, it also consumes the largest footprint per user.

Install Enterprise Server or Enterprise Test Server on a separate server

You can install Enterprise Server¹ or Enterprise Test Server² on a separate server that does not have TS/Citrix installed. By default, Enterprise Server installs and runs as a single-instance product and, within an Enterprise Server, you can operate a number of server instances. Each server provides session and state

¹ Micro Focus Enterprise Server provides full application server support for COBOL applications that require high-performance and mainframe subsystem emulation. Enterprise Server is designed as a multi-user environment.

² Micro Focus Enterprise Test Server is an IBM mainframe application test execution environment on Windows. Enterprise Test Server enables mainframe IT organizations to perform a variety of pre-production testing on low cost commodity hardware, avoiding unnecessary cost and delay. Built on proven technology, Enterprise Test Server exponentially expands the test capacity and enables testing to scale up easily to meet delivery timelines and quality standards driven by today's business requirements.

management for COBOL applications, as well as optionally interfacing with external resource managers to coordinate resource updates.

There are two ways to provide server instances to the developers using Enterprise Developer on the TS/Citrix machine:

- Configure and configure one server instance per developer by specifying different ports. We recommend defining five-digit port numbers where digits one through three identify the developer and four through five identify a unique port. For example: port number 10123 defines a TN3270 listener for developer 1, and port number 10223 defines a TN3270 listener for developer 2.

This option provides a dedicated enterprise server for testing purposes for each developer, but restricts each developer to that one enterprise server instance.

This scenario creates the largest footprint per developer.

Or:

- Create and configure one server instance per application for use by a single development team. Use a different port number for each instance as explained above, using the first three digits to differentiate between applications.

Configuring SQL Option for DB2 (XDB) for Multi-User Environments

SQL Option for DB2 in Enterprise Developer supports scenarios where multiple users use a single XDB Server installed on a TS/Citrix server. Typically, users in such environments would require their own private working locations so they can be isolated from each other's activity on the TS/Citrix server and might require different XDB configuration settings. SQL Option for DB2 provides support for this.

The configuration options for XDB Server are stored in the `xdb.ini` configuration file installed in the Windows protected area in `C:\ProgramData\Microsoft Focus\Enterprise Developer\mfsql\cfg`. `xdb.ini` contains both client-side and server-side settings for the XDB tools.

Changing the server-side settings

In most cases, it is not necessary to change XDB Server's server-side settings. If you need to change these settings, however, it is important that you use the XDB tools to modify the `xdb.ini` file as the tools run with administrator's privileges. This helps avoid some possible issues with Windows virtualizing files in the protected areas that you try to edit without administrator's privileges.

See *Changing the Main XDB Server Configuration File*.

Changing the client-side settings

In multi-user environments such as TS/Citrix, it is important to provide individual users with their own client-side configuration options for XDB. To cater for that, Enterprise Developer provides a utility, `XDBSetup`, which creates a private XDB configuration file for each user in their local Windows folder on the TS/Citrix machine.

Users would run `XDBSetup` before they start using any of the XDB components on the TS/Citrix server. They can then use the XDB Client Options utility (`XOPT40N`) to customize their own version of `xdb.ini` and specify any required client-side run-time options and a temporary space for the client-side tools. For example, they might want to customize various options such as the isolation level, the lock timeout (for example, if they want a longer record lock timeout for testing), the data formats (if they want a different date format to test the software for internationalization issues), the `SQLWizard` configuration, and the private area for saved files.

`XDBSetup` also creates some entries in the user's specific area in the registry which point to the location of the private `xdb.ini` file. This ensures that XDB Server will use the main `xdb.ini` file installed under the `c:\ProgramData` folder, while any of the XDB tools that individual users start will use the private `xdb.ini` files that users might have customized according to their own preferences.

See *Creating a Private XDB Configuration File in a Multi-User Environment*.

Configuring the private XDB Server options in batch

If all users must have the same environment and use a specific standard set of client-side options in their private `xdb.ini` files, a system administrator can set this up for them using a batch file. The batch file would execute `XDBSetup` to create the private `xdb.ini` files and then it would execute `BOPT40N`, the batch version of the XDB Client Options utility, to specify the same client-side options in each private `xdb.ini` file.

See *Changing the Private XDB Server Configuration Files in Batch*.

Creating a Private XDB Configuration File in a Multi-User Environment

Before using XDB Server on a TS/Citrix machine, all users must first run the `XDBSetup` utility to create a private XDB Server configuration file, `xdb.ini`, in their local Windows folders.

To run the utility:

1. Log in to the TS/Citrix machine using the Windows Remote Desktop Connection.
2. Execute the following from an Enterprise Developer command prompt:

```
XDBSetup
```

See *Syntax of the XDBSetup command* for more details.

This creates a standard `xdb.ini` file in the user's Windows home directory, in `c:\Users\username\AppData\Roaming\Micro Focus\Enterprise Developer\mfsql\`, for which the user does not need administrator's credentials to change the file.

This also creates some registry entries in the user's specific area which point to the location of the private `xdb.ini` file. When any of the XDB tools are executed, they check the user's registry settings for whether there is a private configuration file before they check the local machine registry settings which store the location of the main XDB Server configuration file.

Syntax of the XDBSetup command

The XDBSetup utility can run in either an interactive or unattended mode. Use the following syntax to execute the utility:

```
XDBSetup [-u|--unattended]
```

Where you can specify the following options:

No options XDBSetup executes in an interactive mode. You receive some pop-up windows confirming whether the operation completed successfully, prompting whether to overwrite a previously installed `xdb.ini`, and possibly showing any status or error messages.

-u, --unattended XDBSetup executes in an unattended mode.

Log files:

1. A log of the commands activity is output to the standard error output handle.
2. If you need to receive any standard errors, specify ">" to redirect the standard output. To redirect any standard errors, use "2>" as a redirection symbol. If this is not specified, any messages are displayed in the command prompt.

Changing the Main XDB Server Configuration File

The XDB Server configuration file, `xdb.ini`, is installed in a Windows protected location - in `C:\ProgramData\Micro Focus\Enterprise Developer\mfsql\cfg`, by default. You need administrator's privileges to edit the file to help avoid some problems that Windows file virtualization can cause.

Micro Focus recommends that you use the XDB tools to edit `xdb.ini` because the XDB tools include a Windows manifest that requests administrative credentials for updating files in the Windows protected areas. You need to run the tools from the command line and specify `xdb.ini` as an argument. For example, if you use the XDB Client Options utility, execute:

```
XOPT40N /i"C:\ProgramData\Micro Focus\Enterprise Developer\mfsql\cfg\xdb.ini"
```

Avoiding Windows virtualization issues

Files that reside in the Windows protected locations, such as `xdb.ini`, that reside in the Windows protected locations require that you edit them with administrative privileges. If you use utilities such as Notepad that do not request administrator's credentials, Windows file virtualization does not save the modifications in the actual file you edit but creates a copy of the file in the `%userprofile%\AppData\Local\VirtualStore` folder.

From then on, programs that run without administrative credentials use the file in the `VirtualStore` folder while those that run with administrative credentials use the actual `xdb.ini` file which can lead to some confusing results.

Changing the Private XDB Server Configuration Files in Batch

The XDB Client Batch Options command, `BOPT40N`, is a batch version of the XDB Client Options utility, `XOPT40N`.

You can use BOPT40N to modify the options in the `xdb.ini` file in batch. The syntax of the command is as follows:

```
bopt40n /pSection.Variable=Value
```

Where:

Section, *Variable* and *Value* indicate a section in `xdb.ini`, a variable in that section and the value you want to set the variable to.

Note: If any of *Section*, *Variable* or *Value* include any spaces, you must use quotes around the entire argument. In the following example, the connection name has an embedded space in the section name so you need to use quotes around the entire argument in the command as follows:

```
bopt40n "/pConnection MYSERVER.CurrentLocation=MYLOC"
```

Configuring Other Components

Micro Focus Rumba+ Desktop

To use Micro Focus Rumba+ Desktop on a TS/Citrix machine, ensure you install a license for this type of environment. Contact Micro Focus Sales for more information.

ViewNow Installation

To use ViewNow on a TS/Citrix machine, ensure you install a license for this type of environment. Contact Micro Focus Sales for more information.

After Installing

- See *Changes in Behavior or Usage* in your product documentation and in the Release Notes for important information about changes in this release that might affect existing applications.
- Check the *Product Documentation* section of the [Micro Focus SupportLine Documentation Web site](#) for any updates to the documentation which might have been uploaded.

Configuring Enterprise Developer

If you have used Eclipse from the same workspace before, the Eclipse perspective settings are not reset after installing any Micro Focus product. To pick up any new features, you must reset the perspective you are working with after installation:

1. Open the existing workspace with this product.
You may receive some warnings or errors which you can ignore.
2. Make sure you are in the perspective you need to reset by clicking **Window > Perspective > Open Perspective > Other**.
3. From the **Open Perspective** dialog box, click the perspective you want to reset.
4. Click **OK**.
5. Click **Window > Perspective > Reset Perspective**.
6. When prompted, click **Yes**.
7. Reapply any customizations.

On Windows

Installing X Windows on Windows

Some features of Enterprise Developer for Eclipse on Windows require an X Windows installation, hence Micro Focus ViewNowX is provided with the product.

To install ViewNowX:

1. Using Windows Explorer, navigate to the folder that contains the ViewNowX executable. By default, this is %ProgramFiles(x86)%\Micro Focus\Enterprise Developer\ViewNowX.
2. Execute `ViewNow_X_Server.exe` and then `vnx_HF_11327.msp` in that folder.

ViewNowX requires that your client machine has Microsoft Visual C++ 2008 SP1 Redistributable Package (x86) installed. If it is missing from your machine, the ViewNowX installation will offer a link to download the package.

Managing the Microsoft Build Tools and Windows SDK Packages

There are a number of COBOL development features that depend on the Microsoft Build Tools and Windows SDK packages. By default, the product installer downloads and installs these packages to their default locations. The installer then sets your COBOL environment to depend on those downloaded versions.

You can use the Microsoft Build Tools and Windows SDK Packages configuration utility - `cblms` - to view which versions are in use, and also configure your COBOL environment if you require something other than the standard usage.

There is an option within the product installer to skip the installation of the default packages (`skipmstools=1`); however, this does skip both packages, so make sure that you do already have the package(s) that you require before setting this - see *Microsoft Package Dependencies* for details on the package(s) you may require.

The Microsoft Build Tools and Windows SDK Configuration Utility

Use the `cblms` command line utility to view and set the package versions in effect for your COBOL environment.

Important: If you are updating or clearing package versions, you must run this utility from a command prompt with administrative privileges.

Syntax:

```
cblms <option>
```

Parameters:

Note: `<option>` settings are case insensitive.

`<option>` can be one of:

-U

Updates the COBOL environment to use the latest versions of the Microsoft Build Tools and SDK packages that are located in the default folders. Any open IDE instance or command prompt must be restarted before these changes take effect.

-U<ms-pkg>

Updates the COBOL environment to use the latest version of the particular package type that is located in the default folder. Any open IDE instance or command prompt must be restarted before these changes take effect.

-U<ms-pkg>:<version>

Updates the COBOL environment to use a specific version of the particular package type that is located in the default folder. Any open IDE instance or command prompt must be restarted before these changes take effect.

-U<ms-pkg>:<path>

Updates the COBOL environment to use the latest version of the particular package type that is located in the (non-default) folder specified. Any open IDE instance or command prompt must be restarted before these changes take effect.

-U<ms-pkg>:<path>?<version>

Updates the COBOL environment to use a specific version of the particular package type that is located in the (non-default) folder specified. Any open IDE instance or command prompt must be restarted before these changes take effect.

-L

Lists all versions of the Microsoft Build Tools and SDK packages that are located in the default folders.

-L<ms-pkg>

Lists all versions of a particular package type that are located in the default folder.

-L<ms-pkg>:<path>

Lists all versions of a particular package type that are located in the (non-default) folder specified.

-Q

Displays the versions currently in use by the COBOL environment.

-Q<ms-pkg>

Displays the version of the selected package type that is currently in use by the COBOL environment.

-R

Clears all version information. (Only use this option when instructed to by SupportLine.)

-H

Displays the available command line options.

Legend:

<ms-pkg> *<ms-pkg>* can be one of **S** or **SDK** for the Microsoft SDK, or **B** or **BT** for the Microsoft Build Tools.

<path> *<path>* is the path in which to locate packages that are not installed to the default location for their package type.

<version> *<version>* is the package version with which to update when the latest version is not the one required. When specifying *version*, it must be in the form:

- *n.n.n.n* for a Windows SDK
- *n.n.n* for Build Tools
- *n* for list ID - the list ID is displayed using `cb1ms -L`.

The following example updates the COBOL environment to use version 10.0.17134.0 of the Windows 10 SDK, installed in `C:\WinSDK\10`.

```
cb1ms -USDK:C:\WinSDK\10?10.0.17134.0
```

Viewing the Product Help

Enterprise Developer is configured to display the product help available online on the Micro Focus SupportLine Web site: <https://www.microfocus.com/en-us/support/documentation/>.

You can view the Enterprise Developer product help in one of the following ways:

Choose whether to view the help online or locally

You can configure Eclipse to show the Enterprise Developer help either online or locally:

1. In Eclipse, click **Window > Preferences > Micro Focus > Help**.
2. Either disable or enable **Use online documentation**, depending on whether you want to see the documentation locally or online.

Online help (default)

- Click **Help > Micro Focus > Product Documentation**.
- Alternatively, press **F1** inside the editor or from a UI part.

This opens a browser with the Enterprise Developer help.

Note: Ensure that you have an up-to-date version of your browser.

Local help

1. Configure Eclipse to use local help as detailed above.
2. Access the local help in one of the following ways:
 - Click **Help > Help Contents** to open the Help Viewer, then open the **Micro Focus**-branded documentation.
 - Alternatively, press **F1** inside the editor or after clicking a dialog within the UI.

Repairing on Windows

If any product files, registry settings or shortcuts are accidentally removed at any point, you can perform a repair on the installation to replace them.

To repair your installation on versions of Windows Vista or later:

1. From the **Control Panel**, click **Uninstall a program** under **Programs**.
2. Right-click your Micro Focus product and select **Repair**.

Uninstalling

To uninstall the product, you cannot simply delete its files from your hard disk. To uninstall the product:

1. Log in with the same user-ID as you used when you installed the product.
2. Click **Uninstall a program** under **Programs** in **Control Panel**.
3. Select the product and click **Remove** or **Uninstall** as appropriate.

During the uninstall process, only those files added during the installation (to the installation and Samples directories) are removed. If the installation installed the Microsoft Windows 10 SDK or Microsoft Build Tools packages, these are left in place, although the Micro Focus-related registry entries for these packages are removed.

If the product directory has not been removed, delete any unwanted files and subdirectories within it using Windows Explorer.

Note: The installer creates separate installations for Micro Focus Enterprise Developer and Micro Focus License Administration. Uninstalling only Enterprise Developer does not automatically uninstall the Micro Focus License Administration or any of the prerequisite software.

To completely remove the product you must uninstall the Micro Focus License Administration as well.

You can optionally remove the prerequisite software. For instructions, check the documentation of the respective software vendor.

Some registry entries are not removed by the uninstallation process and you need to manually delete them.

The following folders might not be removed:

- The `Micro Focus Product Name` folder in the Start menu - you can delete it manually.
- `%systemdrive%\Users\Public\Documents\Micro Focus` - includes the binaries and the log files of the samples which you have built.
- `%ProgramData%\Micro Focus` - includes some data files used by the Micro Focus licensing system.
- `%Program Files%\Micro Focus` - you can delete it manually.

To silently uninstall the product, you need the setup file and you need to execute the following at the command line:

```
start /wait install-file.exe /quiet /uninstall
```

In addition, the following registry entries are not removed. These are created the first time that an Enterprise Server that has been enabled for performance monitoring starts up:

- `Micro Focus Server\Performance\Active Servers`
- `Micro Focus Server\Performance\PerfIniFile`

On UNIX

Configuring the Remote System Explorer Support

Note: The following only applies if you are using Micro Focus Enterprise Developer UNIX Components with Enterprise Developer for Eclipse.

The remote development support from the Eclipse IDE relies upon Enterprise Developer running on the UNIX machine and handling all requests from the IDE for building and debugging programs. Enterprise Developer provides a UNIX daemon, the Remote Development Option (RDO) daemon, which initiates the RDO as Eclipse clients connect to it. Whichever environment is used to start the RDO daemon will be inherited for all servers and hence all build and debug sessions.

Configuring the Environment

You may need to configure some aspects of the environment before you start the daemon. This is because when a build or debug session is initiated from one of the Eclipse clients, the environment used will be inherited from whatever was used to start the daemon. A typical example of the kind of environment that might need to be set up would include database locations and settings for SQL access at build/run time.

Starting the Daemon

Important: Before starting the daemon you must have the following on your UNIX machine:

- A version of Perl.
- A version of Java 8 or later.
- The `as` (assembler) and `ld` (linking) programs on the path, as specified by the `PATH` environment variable.

To start the daemon on the default port (4075) as a background process, perform this command with superuser authority:

```
$COBDIR/remotedev/startrdodaemon
```

The daemon will now listen for any Eclipse client processes connecting to that machine on port 4075. If you want to use another port, specify another port number on the `startrdodaemon` command.

The daemon can also be configured to instantiate the servers on a specified port or range of ports. This is particularly relevant when you want to only open certain ports through a firewall. To do this, perform this command with superuser authority:

```
$COBDIR/remotedev/startrdodaemon [<port> | <low port>-<high port>]
```

where:

- `<port>` is the port number the daemon should use to listen for connections from Eclipse on the client machine. If no value is given, it will be assigned a default value of 4075. This value matches the value assigned within the Eclipse installation.

For example,

```
$COBDIR/remotedev/startrdodaemon 4999
```

This command will start a daemon listening on port 4999 and will use random server ports.

- `<low port>-<high port>` is the range of ports on which the servers (launched by the daemon) should use to communicate with Eclipse on the client machine.

For example,

```
$COBDIR/remotedev/startrdodaemon 4080 4090-4999
```

This command will start a daemon listening on port 4080 and server ports will be in the range 4090 to 4999.

Stopping the Daemon

To stop the daemon, type the following command with superuser authority:

```
$COBDIR/remotedev/stoprdodaemon <port>
```

Enabling SHIFT-JIS

By default, support for the character encoding for the Japanese language, Shift-JIS, is not available on Ubuntu and on RedHat OS version 8 or later.

You need to generate the Shift JIS locale on your machine to be able to execute Shift-JIS applications on these platforms. You can do this as follows:

1. On RedHat 8, ensure that the `glibc-locale-source` package is installed.
2. Execute the following command with superuser rights in order to generate a Shift-JIS locale using the charset:

```
sudo localedef -f SHIFT_JIS -i ja_JP ja_JP.sjis
```

3. Set the `COBUTF8` environment variable to the generated Shift-SJIS locale and `LANG` to a UTF8 locale:

```
export COBUTF8=ja_JP.sjis
export LANG=ja_JP.UTF-8
```

4. Run the `cobutf8` utility:

```
cobutf8 <command>
```

See your product documentation for more details about `cobutf8`.

Repairing on UNIX

If a file in the installation of the product becomes corrupt, or is missing, we recommend that you reinstall the product.

Uninstalling

Note: Before you uninstall the product, ensure that the Enterprise Server instances and the Micro Focus Directory Service (MFDS) are stopped.

To uninstall this product:

1. Execute as root the `Uninstall_EnterpriseDeveloper6.0.sh` script in the `$COBDIR/bin` directory.

Note: The installer creates separate installations for the product and for Micro Focus License Administration. Uninstalling the product does not automatically uninstall the Micro Focus License Administration or the prerequisite software. To completely remove the product you must uninstall the Micro Focus License Administration as well.

To uninstall Micro Focus License Administration:

1. Execute as root the `UnInstallMFLicenseServer.sh` script in the `/var/microfocuslicensing/bin` directory.

The script does not remove some of the files as they contain certain system settings or licenses.

You can optionally remove the prerequisite software. For instructions, check the documentation of the respective software vendor.

Licensing Information

Note:

- If you have purchased licenses for a previous release of this product, those licenses will also enable you to use this release.
- If you are unsure of what your license entitlement is or if you wish to purchase additional licenses, contact your sales representative or [Micro Focus SupportLine](#).

To start Micro Focus License Administration

Windows

Windows 8.1 From the Windows **Start** screen, click the **License Administration** tile.

Windows 10 and Later From your Windows desktop, click **Start > Micro Focus License Manager > License Administration**.

UNIX

Log on as root, and from a command prompt type:

```
/var/microfocuslicensing/bin/cesadmintool.sh
```

Installing licenses

You need either a license file (with a `.mflic` extension) or an authorisation code which consists of a string of 16 alphanumeric characters.

If you have a license file

Windows

1. Start Micro Focus License Administration.
2. Click the **Install** tab.
3. Do one of the following:
 - Click **Browse** next to the **License file** field and select the license file (which has an extension of `.mflic`).
 - Drag and drop the license file from Windows Explorer to the **License file** field.
 - Open the license file in a text editor, such as Notepad, then copy and paste the contents of the file into the box below the **License file** field.
4. Click **Install Licenses**.

Alternatively, you can install the license file from within the IDE as follows:

1. Start Enterprise Developer.
2. Click **Help > Micro Focus > Product Licensing** to open the **Product Licensing** dialog box.
3. Ensure **I have a full Enterprise Developer Team Edition license** is checked.
4. Click **Browse** next to the **License file** field.

5. Select the license file (which has an extension of `.mflic`), and then click **Open**.
6. Click **Finish** to install the license.

UNIX

1. Start the Micro Focus License Administration tool and select the **Manual License Installation** option by entering 4.
2. Enter the name and location of the license file.

If you have an authorization code

Authorizing your product when you have an Internet connection

Note:

- It is not possible to install licenses remotely. You must be logged into the machine on which you are installing the licenses.

The following procedure describes how to authorize your product using a local or network license server. The license server is set up automatically when you first install the product.

Windows

1. Start Micro Focus License Administration.
2. Click the **Install** tab.
3. Type the authorization code in the **Enter authorization code** field.
4. Click **Authorize**.

If you change the name of the machine running your license server after it has granted licenses, the licenses stop working.

UNIX

1. Start Micro Focus License Administration.
2. Select the **Online Authorization** option by entering 1 and pressing **Enter**.
3. Enter your authorization code at the **Authorization Code** prompt and then press **Enter**.

Authorizing your product when you don't have an Internet connection

This method of authorization is required if the machine you want to license does not have an Internet connection or if normal (automatic) authorization fails.

Windows

1. Start Micro Focus License Administration.
2. On the Install tab, click **Manual Authorization**.
3. Make a note of the contents of the **Machine ID** field. You will need this later.
4. Do one of the following:
 - If your machine has an Internet connection, click the SupportLine Web link in the Manual Authorization Information window.
 - If your machine does not have an Internet connection, make a note of the Web address and type it into a Web browser on a machine that has an Internet connection.

The Micro Focus SupportLine Manual product authorization Web page is displayed.

5. Type the authorization code in the **Authorization Code** field. The authorization code is a 16-character alphanumeric string supplied when you purchased your product.

6. Type the Machine ID in the **Machine ID** field.
7. Type your email address in the **Email Address** field.
8. Click **Generate**.
9. Copy the generated license string (or copy it from the email) and paste it into the box under the **License file** field on the Install page.
10. Click **Install Licenses**.

UNIX

In order to authorize your product you must have the following:

- Access to a computer which is connected to the Internet.
- Your authorization code (a 16-character alphanumeric string).
- The machine ID. To get this, start the Micro Focus License Administration tool and select the **Get Machine Id** option by inputting 6. Make a note of the "Old machine ID".

If you have previously received the licenses and put them in a text file, skip to step 6.

1. Open the Micro Focus license activation web page <http://supportline.microfocus.com/activation> in a browser.
2. Enter your authorization code and old machine ID and, optionally, your email address in the **Email Address** field.
3. Click **Generate**.
4. Copy the licenses strings from the web page or the email you receive into a file.
5. Put the license file onto your target machine.
6. Start the Micro Focus License Administration tool and select the **Manual License Installation** option by inputting 4.
7. Enter the name and location of the license file.

To obtain more licenses

If you are unsure of what your license entitlement is or if you wish to purchase additional licenses for Enterprise Developer, contact your sales representative or Micro Focus SupportLine.

Updates and SupportLine

Our Web site provides up-to-date information of contact numbers and addresses.

Further Information and Product Support

Additional technical information or advice is available from several sources.

The product support pages contain a considerable amount of additional information, such as:

- The *Product Updates* section of the Micro Focus SupportLine Web site, where you can download fixes and documentation updates. Go to [Micro Focus Product Updates](#)
- The *Examples and Utilities* section of the Micro Focus SupportLine Web site, including demos and additional product documentation. Go to <https://supportline.microfocus.com/examplesandutilities/index.aspx>.
- The *Support Resources* section of the Micro Focus SupportLine Web site, that includes troubleshooting guides and information about how to raise an incident. Go to <https://supportline.microfocus.com/supportresources.aspx>

To connect, enter <https://www.microfocus.com/en-us/home/> in your browser to go to the Micro Focus home page, then click **Support & Services > Support**. Type or select the product you require from the product selection dropdown, and then click **Support Login**.

Note: Some information may be available only to customers who have maintenance agreements.

If you obtained this product directly from Micro Focus, contact us as described on the Micro Focus Web site, <https://www.microfocus.com/support-and-services/contact-support/>. If you obtained the product from another source, such as an authorized distributor, contact them for help first. If they are unable to help, contact us.

Also, visit:

- The Micro Focus Community Web site, where you can browse the Knowledge Base, read articles and blogs, find demonstration programs and examples, and discuss this product with other users and Micro Focus specialists. See <https://community.microfocus.com>.
- The Micro Focus YouTube channel for videos related to your product. See [Micro Focus Channel on YouTube](#).

Information We Need

However you contact us, please try to include the information below, if you have it. The more information you can give, the better Micro Focus SupportLine can help you. But if you don't know all the answers, or you think some are irrelevant to your problem, please give whatever information you have.

- The name and version number of all products that you think might be causing a problem.
- Your computer make and model.
- Your operating system version number and details of any networking software you are using.
- The amount of memory in your computer.
- The relevant page reference or section in the documentation.
- Your serial number . To find out these numbers, look in the subject line and body of your Electronic Product Delivery Notice email that you received from Micro Focus.

On Windows, if you are reporting a protection violation you might be asked to provide a dump (.dmp) file. To produce a dump file you use the **Unexpected Error** dialog box that is displayed when a protection

violation occurs. Unless requested by Micro Focus SupportLine, leave the dump setting as `Normal` (recommended), click **Dump**, then specify a location and name for the dump file. Once the dump file has been written you can email it to Micro Focus SupportLine.

Alternatively, you might be asked to provide a log file created by the Consolidated Tracing Facility (CTF) - a tracing infrastructure that enables you to quickly and easily produce diagnostic information detailing the operation of a number of Micro Focus software components.

On Windows, you can use the Micro Focus SupportLine Support Scan Utility, `MFSupportInfo`, to create either:

- a `.log` file that contains the details about your environment, Micro Focus SupportLine products, and settings.
- a `.zip` archive that includes the same information as the `.log` file plus some product configuration files from `c:\ProgramData` and the product installation log files.

`MFSupportInfo.exe` is stored in `<install-dir>\bin`.

To run `MFSupportInfo`:

1. Start a 32-bit Enterprise Developer command prompt.
2. Enter `MFSupportInfo` at the command prompt to start the utility.
3. Create a `.log` file or a `.zip` archive as follows:

- a. To create a `.log` file, click **File > Save**.

This prompts to save the `.log` file, `MFSupportInfo_Log_MachineName_YYYY-MM-DD_HH-MM-SS.log`, in the `%temp%` directory.

- b. To create a `.zip` archive, click **Tools > Create Zip Package**.

This creates a `.zip` archive, `MFSupportInfo_Log_MachineName_YYYY-MM-DD_HH-MM-SS.zip`, in the `%temp%` directory.

4. Send the diagnostic information to your Micro Focus SupportLine representative:

The following requires an Internet connection and an Email client:

- a. Click **Tools > Email Log to SupportLine** to open the **Email Log** dialog box.
- b. Fill in the required fields and click **Send**.

If the machine is not connected to the Internet or if there are no Email clients installed, copy either the `.log` file or the `.zip` archive to a machine that is connected to the Internet. Use your Email client to email the files to Micro Focus SupportLine at supportline@microfocus.com together with the Support Incident (SI) number, if available, and any additional details that might be useful to diagnose the issues that you are experiencing.

1. Start a UNIX shell.
2. Set `COBDIR` to the product with issues.
3. Execute `mfsupport` from a directory where you have write permissions.

This creates a log file, `mfpoll.txt`, in that directory.

4. When the script finishes, send the `mfpoll.txt` file to your Micro Focus SupportLine representative.

Note:

If `COBDIR` is set to a location that does not contain `etc/cobver`, the script outputs the contents of `/opt/microfocus/logs/MicroFocusProductRegistry.dat` which keeps a list of the installed Micro Focus products.

If `COBDIR` is set to a location that does not contain `etc/cobver` or `COBDIR` is not set, `mfsupport` gives you the option to search your machine for possible product locations. Note that the search can take some time if you have a large amount of disc storage and files.

Creating Debug Files

If you encounter an error when compiling a program that requires you to contact Micro Focus SupportLine, your support representative might request that you provide additional debug files (as well as source and data files) to help us determine the cause of the problem. If so, they will advise you how to create them.
